This supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A07.

INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 447 reports, journal articles and other documents originally announced in February 1988 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

Information on the availability of cited publications including addresses of organizations and NTIS price schedules is located at the back of this bibliography.

TABLE OF CONTENTS

	Page
Category 01 Aeronautics (General)	63
Category 02 Aerodynamics Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.	67
Category 03 Air Transportation and Safety Includes passenger and cargo air transport operations; and aircraft accidents.	83
Category 04 Aircraft Communications and Navigation Includes digital and voice communication with aircraft; air navigation systems (satel- lite and ground based); and air traffic control.	86
Category 05 Aircraft Design, Testing and Performance Includes aircraft simulation technology.	87
Category 06 Aircraft Instrumentation Includes cockpit and cabin display devices; and flight instruments.	97
Category 07 Aircraft Propulsion and Power Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft.	98
Category 08 Aircraft Stability and Control Includes aircraft handling qualities; piloting; flight controls; and autopilots.	100
Category 09 Research and Support Facilities (Air) Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands.	105
Category 10 Astronautics Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; space communications, spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft pro- pulsion and power.	108
Category 11 Chemistry and Materials Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; propellants and fuels; and materials processing.	108

Category 12 Engineering	111
Includes engineering (general); communications and radar; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.	
Category 13 Geosciences	119
Includes geosciences (general); earth resources and remote sensing; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.	
Category 14 Life Sciences	N.A.
Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and space biology.	
Category 15 Mathematical and Computer Sciences	119
Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.	
Category 16 Physics	122
Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.	
Category 17 Social Sciences	127
Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law, political science, and space policy; and urban technology and transportation.	
Category 18 Space Sciences	N.A.
Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.	
Category 19 General	N.A.
Subject Index	A-1
Personal Author Index	B-1
Corporate Source Index	C-1
Foreign Technology Index	D-1
Contract Number Index	E-1
Report Number Index	F-1

The Highly Manueverable Aircraft Technology (HiMAT) program consisted of design, fabrication of two subscale remotely piloted research vehicles (RPRVs), and flight test. This technical memorandum describes the vehicles and test approach. An overview of the flight test results and comparisons with the design predictions are presented. These comparisons are made on a single-discipline basis, so that aerodynamics, structures, flight controls, and propulsion controls are examined one by one. The interactions between the disciplines are then examined, with the conclusions that the integration of the various technologies contributed to total vehicle performance gains. An assessment is made of the subscale RPRV approach from the standpoint of research data quality and quantity, unmanned effects as compared with manned vehicles, complexity, and cost. It is concluded that the RPRV technique, as adopted in this program, resulted in a more complex and costly vehicle than expected but is reasonable when compared with alternate ways of obtaining comparable results.

ACCESSION NUMBER → **A88-10095#**

TITLE → **SYNTHESES OF REDUCED-ORDER CONTROLLERS FOR ACTIVE FLUTTER SUPPRESSION**

AUTHORS → ATSUSHI FUJIMORI and HIROBUMI OHTA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 35, no. 402, 1987, p. 353-362. In Japanese, with abstract in English. refs ← JOURNAL TITLE

Reduced-order controllers for active flutter suppression of a two-dimensional airfoil are studied using two design approaches. One is based on the generalized Hessenberg representation (GHR) in the time domain, and the other, called the Nyquist frequency approximation (NFA), is a method in the frequency domain. In the NFA method, the reduced-order controllers are designed so that the stability margin of the Nyquist plot may be increased over a specific frequency range. To illustrate and to make a comparison between the two methods, numerical simulations are carried out using a thirteenth-order controlled plant. It is to be noted that the GHR method can yield quasi-optimal controllers in the sense of minimizing quadratic performance indices. The designed controllers, however, do not have enough stability margin, and the order reduction resulting from full state controllers may not be satisfactory. On the other hand, reduced-order controllers in the NFA method can be designed with increased stability margin at the expense of the performance index. For all simulation cases, the NFA method yields second-order controllers with a better stability margin than those by the GHR method. Thus, the NFA method provides an effective method for synthesizing robust reduced-order controllers.

AIRSHIPS FACE A MILITARY FUTURE

MICK HAMER New Scientist (ISSN 0028-6664), vol. 115, Sept. 24, 1987, p. 38-40.

The Sentinel 5000 is a large (50,000 cu m) semirigid airship which will begin USN AWACS operations trials in 1990, equipped with a massive surveillance radar installed within its envelope. The lift capacity of the Sentinel 5000 will be such as to enable a hypothetical civilian version to carry 120-150 passengers. The development of this helium lift gas airship has been prompted by the need for naval task force AWACS coverage for periods of more than two days. Sentinel 5000 has a mission endurance of 55 hours. If the trials are successful, between 40 and 50 airships of this type may be ordered by the USN. O.C.

DEFENSE SUPPRESSION TECHNOLOGY ALTERNATIVES FOR FUTURE GENERATION AIRCRAFT

RICHARD A. NIKSCH (McDonnell Aircraft Co., Saint Louis, MO) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 7 p. (AIAA PAPER 87-2925)

The Defense Suppression Study was conducted to assess advanced technology alternatives as they applied to new conceptual designs of manned and unmanned air vehicles performing the year-2000 Defense Suppression role. The study identified the future defense suppression needs, through scenario/threat definitions, provided potential answers through conceptual manned/unmanned air vehicles, evaluated the concepts as they related to the combat potential of the attack forces, and made critical technology assessments and recommendations of what needs to be done to meet future requirements. Four manned and several unmanned vehicles were designed and analyzed. Additionally ten advanced weapons were evaluated, many potential advanced avionics were determined, and eight tactics methods were contrived and evaluated, using the new technology capabilities. TECHNICAL THRESHOLDS FOR REVITALIZING GENERAL AVIATION

E. F. KRAUS (Cessna Aircraft Co., Wichita, KS) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 12 p. refs (AIAA PAPER 87-2933)

The decline in general aviation sales in the 1980's is shown to be the result of numerous interdependent factors in the overall aviation environment. While lower costs and improved features and performance would positively affect sales, a review of market conditions indicates that the threshold for accomplishing a significant market turnaround through cost and performance improvements alone is beyond the near term application of

advanced aerodynamics, propulsion and materials technologies. While such improvements remain essential for the success of new designs, they are shown to play a secondary role in the marketplace to technologies that lower the real barriers to a larger market for personally flown aircraft. Although market variables do not provide the basis for rigorous proof, appropriate technologies for market expansion are indicated. Author

A88-14282#

SYSTEM DESIGN AND EFFECTIVENESS - IMPROVING BUILT-IN-TEST DESIGNS

TRACY H. JACKSON (McDonnell Aircraft Co., Saint Louis, MO) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 5 p. refs (AIAA PAPER 87-2945)

This paper describes the background work used to determine causes of Cannot Duplicate (CND) and Bench Checked, Serviceable (BCS) action. A new figure of merit, Expanded Maintenance Importance Ratio is discussed. Techniques for eliminating CND and BCS actions through off-aircraft techniques are discussed, using data from in-depth studies. Current efforts to identify on aircraft improvements in flight control systems are discussed. Development efforts discussed include: (1) a built-in-test effectiveness model used to unambiguously quantify diagnostic results; (2) near real time diagnostic systems for use on board aircraft; and (3) suggested on aircraft measurements required to eliminate CND and BCS diagnostic results. Author

A88-14283#

THE CHANGING WORLD OF FLIGHT TESTING

ORVILLE WRIGHT, JR. (IBM, Federal Systems Div., Owego, NY) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 4 p. refs (AIAA PAPER 87-2948)

The paper discusses the evolution of flight testing from the first military flight demonstration in 1908 to the present day evaluations. It highlights the reasons that are causing the changes in testing methodology: enormous costs of weapon systems, advancing technology, long development cycle, and user impatience with unreliable equipment. In addition, it projects the future direction in view of the emerging role of avionics systems, simulation, joint test teams and software flexibility. Author

A88-14301

AIRSHIP DESIGN AND OPERATION - PRESENT AND FUTURE; PROCEEDINGS OF THE INTERNATIONAL CONFERENCE, LONDON, ENGLAND, NOV. 18, 19, 1986. VOLUMES 1 & 2

Conference sponsored by the Royal Aeronautical Society and Airship Association. London, Royal Aeronautical Society, 1986, p. Vol. 1, 99 p.; vol. 2, 261 p. 360 p. For individual items see A88-14302 to A88-14317.

The present conference on the state of the art in LTA craft development discusses design trends observable in recent airships, emerging civil applications for airships, the development of a large nonrigid airship, the design and construction of the UM10 ultralight nonrigid airship, military and civilian applications for tethered aerostats, the static, dynamic and powered-static components of airship lift, and test flight results for the 'Cyclo-crane' proof-of-concept airship. Also discussed are military applications for airships, long endurance airship design challenges, the status

01 AERONAUTICS (GENERAL)

of airship flight dynamics research, RPV-carrying airships, the passenger potential of airships, a toroidal balloon concept, and the case for a solar-powered airship. O.C.

A88-14302

RECENT AIRSHIP DESIGNS AND TODAY'S ACHIEVEMENTS

A. W. L. NAYLER (Royal Aeronautical Society, London, England) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 1. London, Royal Aeronautical Society, 1986, p. 2.1 to 2.10. refs

An evaluation is made of advancements in airship design since 1971, encompassing rigid airships for heavy-lift requirements as well as the smaller, more numerous nonrigid airships developed for surveillance, forestry, and advertising applications. Britain, the USA, Canada, Mexico, Germany, the USSR, Australia, New Zealand, and Japan all have active private or military airship development programs. The US and French navies have already undertaken trials to ascertain the applicability of nonrigid airships to task force surveillance. O.C.

A88-14303

CIVIL APPLICATION FOR AIRSHIPS BY AIRSHIP INDUSTRIES

GEORGE SPYROU (Airship Industries /UK/, Ltd., London, England) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 1. London, Royal Aeronautical Society, 1986, p. 3.1 to 3.8.

A total of nine airships have been constructed by the presently discussed British company over the last 15 years. Successful civil applications have been found for these vehicles in advertising/promotion, aerial TV/film/photographic coverage of outdoor events, aerial surveillance, geophysical and hydrographic surveying, and passenger/sightseeing tours. The company has recently entered into a partnership with a major U.S. defense electronics manufacturer to develop surveillance airships for the USN, designated the 'Sentinel 5000'. O.C.

A88-14304

THE DEVELOPMENT OF THE LARGE NON RIGID AIRSHIP

J. R. MUNK (Airship Industries /UK/, Ltd., London, England) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 1. London, Royal Aeronautical Society, 1986, p. 4.1 to 4.7.

A partnership between a British airship manufacturer and a U.S. defense electronics manufacturer has been contracted by the USN to develop a large nonrigid AEW airship for use in fleet radar surveillance. The radar antenna is large and mounted on a quadropod structure above the gondola. The hull form used is inherently resistant to buckling under load, and employs high tear strength/low weight fabric. Advanced composites are used in the tail fins, nose cone battens and strakes of the hull. Attention is given to the cruise propulsion system's drivetrain configuration and the fly-by-light control system. O.C.

A88-14308

MILITARY AND CIVIL APPLICATIONS FOR AIRSHIPS

DAVID B. BAILEY (U.S. Navy, Naval Air Development Center, Warminster, PA) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 11.1 to 11.68. refs

This comprehensive treatment of LTA vehicle development history, current status, and future trends, encompasses existing military and commercial development programs on a country-by-country basis, the design and operational lessons learned from the classic generation of rigid (Akron, Graf Zeppelin) and nonrigid (ZPG-2, ZPG-3) airships, and the results of numerous experiments with exotic LTA vehicle concepts, such as hybrid-lift semibuoyant airships. Attention is given to tethered aerostats, the operational hazards and capabilities of the USN's World War II

escort blimps, and the general construction principles of each airship type. O.C.

A88-14309

THE DESIGN CHALLENGE OF A LONG ENDURANCE AIRSHIP

R. H. HILLSDON (Airship Industries /UK/, Ltd., London, England) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 12.1 to 12.12.

The U.S. Navy Airship Program ('NASP') is concerned with the development of airships for a long-endurance oceanic surveillance role. An account is given of the engineering tradeoff study determinations that entrants into the NASP design competition will have to make, in light of numerous constraints and criteria that are either intrinsic to long mission duration airship operations, or extrinsically introduced by surveillance radar accommodation and other such specific, mission-related requirements. Attention is given to propulsion system options, ballonet configuration factors, and reliability and maintainability issues associated with the stipulated 720-hour mission length. O.C.

A88-14312

RPV CARRYING AIRSHIPS

B. SHAW (Ministry of Defence Royal Navy, London, England) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 15.1 to 15.6.

A technological, operational, and economic feasibility evaluation is presented for the use of airships as platforms for the launch, monitoring, control, and recovery of RPVs outfitted with sensors for sea and air attack-warning reconnaissance. It is noted that the size and speed disadvantages of airships in high intensity warfare scenarios can be compensated for by the speed, agility, and undetectability of RPVs equipped with highly miniaturized, but powerful, radar and IR sensors. This use of airships and RPVs would not only be less expensive than current alternatives, but would free higher-valued aircraft for more pressing tasks. O.C.

A88-14313

A DEMONSTRATION OF THE USE OF AN AIRSHIP FOR TOWING A REFLECTIVE SPHERE AT MEDIUM ALTITUDES

K. N. READER (Royal Signals and Radar Establishment, Malvern, England) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 16.1 to 16.10.

The suitability and economy of two different helicopters, a jet aircraft, and an airship are presently considered in the role of towing vehicles for a radar range-performance calibration reflecting target sphere of 3-ft diameter. The VTOL and hover capabilities of the airship render its performance comparable to that of the helicopters, with far lower costs than either the helicopters or the jet aircraft. An agreement of better than 20 percent is obtained between measured and predicted figures. O.C.

A88-14371

THE EXPERIMENTAL AIRCRAFT PROGRAMME

JOHN VINCENT (British Aerospace, PLC, Military Aircraft Div., Weybridge, England) SAE, Aerospace Vehicle Conference, Washington, DC, June 8-10, 1987. 17 p. (SAE PAPER 871347)

The Experimental Aircraft Program is a demonstrator aircraft program involving the equipment industries of the UK, the FRG and Italy. The program part funded by UK MoD(PE) was aimed at developing those technologies necessary for any future advance fighter aircraft. These included an advanced aerodynamic configuration requiring full authority digital computer-based flight controls. A utilities and systems management system integrated by data bus with avionics provides the pilot with a modern electric cockpit. Advanced materials are used in primary and secondary

structure. The timescale from contract signature to first flight was three years. Flight development is continuing. Author

A88-14878#

AERONAUTICAL DEVELOPMENTS FOR THE 21ST CENTURY
JOHN M. SWIHART (Boeing Co., Seattle, WA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 13-16, 1987. 48 p. refs
(AIAA PAPER 87-3052)

A comprehensive projection is made of commercial aviation market possibilities for prospective technology development trends in subsonic, supersonic, and hypersonic aircraft designs. Attention is given to the advantages in propulsion efficiency and supersonic airframe temperature control that may be obtained through the use of such exotic fuels as liquid hydrogen and methane (especially in the hypersonic regime), as well as to the range extension and takeoff gross weight reduction that can be obtained from the incorporation of active boundary layer control in both subsonic and supersonic aircraft. SST boundary layer control is noted to offer the further advantages of reduced skin aerodynamic friction-induced heat and sonic boom overpressure reduction.

O.C.

A88-14879

AIRCRAFT MAINTENANCE AND PRODUCTION TECHNOLOGY; SYMPOSIUM, TECHNISCHE HOGESCHOOL DELFT, NETHERLANDS, APR. 25, 1986, PROCEEDINGS [ONDERHOUDS- EN PRODUCTIE-TECHNIEKEN IN DE LUCHTVAART; SYMPOSIUM, TECHNISCHE HOGESCHOOL DELFT, NETHERLANDS, APR. 25, 1986, PROCEEDINGS]

Delft, Netherlands, Vliegtuigbouwkundige Studievereniging, 1986, 87 p. In Dutch. No individual items are abstracted in this volume.

State-of-the-art manufacturing and maintenance procedures for commercial transport aircraft are surveyed, with a focus on developments in the Netherlands. Topics addressed include the technological history of the aircraft industry (emphasizing the trend toward greater automation), the use of composite materials in aircraft structures, the production and repair of undercarriages, and the automated production of cable harnesses. Consideration is given to methods for improving aircraft maintainability, motor maintenance, and the maintenance of aircraft exteriors. Extensive diagrams, drawings, graphs, photographs, and tables of numerical data are provided.

A88-15116

THE ANALYSIS OF AIRCRAFT COMPONENT FAILURES

A. JONES and C. J. PEEL (Royal Aircraft Establishment, Farnborough, England) IN: Analyzing failures: The problems and the solutions. Metals Park, OH, ASM International, 1986, p. 201-208.

This paper outlines the developments in both understanding the failures and the practical techniques that have been applied in their interpretation. Previous failures are reviewed, and the relative importance of the various failure modes encountered indicated, emphasizing the dominant role of fatigue of metal structures and the improvements that have occurred, particularly with corrosion related problems. Improved techniques for the quantitative analysis of fatigue failures are explained and illustrated, including combined fractographic and fracture mechanics analyses.

TILTING AT NEW AVIATION MARKETS

HELEN GAVAGHAN New Scientist (ISSN 0028-6664), vol. 116, Oct. 1, 1987, p. 38-43.

A new aircraft called a tiltrotor has been developed which takes off as a helicopter; the rotors on the wing then tilt through 90 deg so that the aircraft can fly as a conventional turboprop aircraft. The tiltrotor combines a helicopter's ability to take off and land from confined spaces with the fuel efficiency and speed of a turboprop for the flight between destinations. For the armed forces, an aircraft that has the versatility and speed of a fixed-wing aircraft and yet can land in a battle zone which has no prepared

landing surface, has many advantages. For civil operation, such aircraft operating between city centers, could relieve the growing tension at airports. The European concept, known as Eurofar, is described. The Osprey, the direct descendent of an experimental tiltrotor (XV3) is scheduled to fly for the first time in June of 1988. K.K.

APPLICATION OF 'PADDING OFFSET' IN AIRCRAFT ASSEMBLY

FANGLIN XIE (Shanxi Aircraft Co., People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 8, June 1987, p. B321-B325. In Chinese, with abstract in English.

In aircraft assembly, clearance often occurs between assembly components caused by random and systematic errors. This article discusses the theoretic basis and technological specification of a padding treatment for assembly clearance. Also proposed is the proper application of padding offset method, so as to simplify the complicated coordination procedure for the purpose of reducing cost and improving product quality.

AEROSPACEPLANE - NASA'S FLAME REKINDLED

JULIAN MOXON Flight International (ISSN 0015-3710), vol. 132, Oct. 10, 1987, p. 31, 32.

The NASA/USAF joint National Aerospaceplane ('NASP') program has as its goal the creation of a Mach 25-capable, SSTO vehicle that will also be able to sustain endoatmospheric hypersonic cruise for passenger-carrying and reconnaissance missions. The testing of the integration of numerous state-of-the-art technologies involved in NASP has generated the further requirement for the creation of the X-30 test vehicle. Attention is presently given to the programmatic consequentiality of the development of an operational scramjet powerplant that can achieve sustained operation in the X-30.

LIGHTER THAN AIR INTERNATIONAL CONFERENCE, VANCOUVER, CANADA, SEPT. 18, 19, 1986, PROCEEDINGS

WILLIAM A. GAJDA, ED. Conference sponsored by Transport Canada, UNIDO, ICAO, et al. Edmonton, Canada, Lighter Than Air International, 1986, 264 p. For individual items see A88-16652 to A88-16663.

The present conference on the development status of LTA vehicles discusses the 'Dynairship' lifting body vehicle, the 'Cyclocrane' LTA vehicle, the elimination of negative airship characteristics through innovative design, the BUZ rigid-pressure airship, LTA-based aerial logging, the status of the GZ-22 airship program, and the 'Helitruck' rigid airship. Also considered are the 'Hystar' aerodyne airship, the development of the Canadian north using an LTA network, maritime missions using an integrated LTA role, the development of naval airships, military and civilian applications for tethered aerostats, and the implications of technological advancements in LTA systems for developing countries.

O.C.

A88-16652

THE DYNAIRSHIP - A LIFTING BODY AIRSHIP FOR CARGO

WILLIAM MCE. MILLER, JR. (Aereon Corp., Princeton, NJ) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 7-20.

The deurbanization of populations and commerce, the rise of dispersed light industries, and the high cost of surface transport infrastructure in the industrialized countries, all converge to create the need for an 'aerial truck' having high payload volume and weight capacity, adaptability, simplicity, and fuel economy. The difficulty and cost of conventional land transportation infrastructure development in the Third World also presents valuable opportunities for aircraft with such capabilities. Attention is presently given to the design and capabilities of a delta-planform hybrid-lift airship that addresses these transportation requirements.

O.C.

01 AERONAUTICS (GENERAL)

A88-16653

THE CYCLO-CRANE - AN LTA HYBRID SUCCESS STORY

JOHN R. AIKMAN (Aerolift, Inc., Tillamook, OR) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 21-27.

A development history and current status evaluation are presented for the 'Cyclo-Crane' hybrid-lift vehicle, a piloted test model of which was flown last year. Attention is given to this craft's operational and economic advantages over alternative forms of air transportation, its potential civil and military applications, and its commercial prospects. The pilot controls of the Cyclo-Crane are virtually identical to those of a helicopter; the craft operates without need for ballast, as conventional airships do. Only about 25 percent of the rotor lift power of a conventional helicopter is required for a comparable load. O.C.

A88-16654

ELIMINATION OF AIRSHIP NEGATIVE FEATURES THROUGH INNOVATION AND DESIGN

W. E. WRIGHT (Arrowhawk Developments, Inc., Medley, Canada) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 83-92.

The status of the 'Arrowhawk' hybrid LTA vehicle design development effort, which has been in existence for six years, is discussed with attention to this configuration's novel integration of numerous features and capabilities generally associated with dirigibles, helicopters, and conventional fixed-wing aircraft. The Arrowhawk vehicle employs a rigid composite shell to define a helium lifting-gas volume whose external contours also define an aerodynamically functional lifting body. The craft is applicable to police patrols, coastal surveillance, search-and-rescue, and forestry surveillance. O.C.

A88-16655

AERIAL LOGGING

G. V. WELLBURN (Forest Engineering Research Institute of Canada, Vancouver) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 101-105. refs

The British Columbia forest industry requires a flight vehicle suitable for logging operations whose operational characteristics are comparable to those of a large cargo helicopter but whose economies of ownership and operation are significantly better. The size of the market for such aircraft depends on their cost-competitiveness relative to conventional cable logging under difficult terrain and weather conditions. Attention is given to the suitability of the 'Cyclo-Crane' LTA vehicle concept for such an application. O.C.

A88-16656

THE DEVELOPMENT OF THE GZ-22 AIRSHIP PROGRAM

RONALD G. E. BROWNING (Goodyear Aerospace Corp., Akron, OH) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 111-112.

While the GZ-22 airship was initially conceived with the requirements of advertising blimps in mind, innovative features incorporated in the design of its car, flight controls, avionics, instrumentation, and propulsion system render it suitable for military applications. The GZ-22 is of the same dimensions as the ZPG-3W airships built for the USN around 1960, but will be faster, more maneuverable, and more difficult to detect than earlier airships. It will stay on station 72 hours without refueling; power will be provided by a combination of gas turbine-driven generators and electric motors, which will in turn drive vectorable ducted propellers. O.C.

A88-16657

AIRSHIPS IN THE MARKET PLACE

FRED R. NEBIKER (Goodyear Aerospace Corp., Akron, OH) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 113-122.

A comprehensive evaluation is presented of the development efforts undertaken by a large U.S. nonrigid airship manufacturer over the course of several decades, even in a climate which promised no market for military airships. It is this market, however, which promises to revive in the coming years, and will require new airship designs to undertake over-the-horizon anticruise missile surveillance functions with large radar arrays in defense of USN task forces. Other foreign military services have expressed interest in airships capable of this function. O.C.

THE EMERGENCE OF THE RIGID AIRSHIP IN THE HELITRUCK

JUERGEN BOTHE (Helitrans, Inc., Walldorf, Federal Republic of Germany) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 123-129.

By the year 2000, more than 75 percent of all mankind will live in areas possessing less than 15 percent of the globally available ground transportation infrastructure; these 4 billion people will have to be supplied aerially with various types of cargo. This function is the mission requirement for which the presently described 'Helitruck' vehicle concept was conceived. Helitruck consists of a 40-m long, 3.2-slenderness ratio lifting body equipped with four vectorable propellers, as well as an LFC suction-supplying ducted fan. Some 40 passengers can be accommodated by the craft in VTOL, and 75 in STOL operations. O.C.

A88-16659

THE HYSTAR AERODYNE AIRSHIP

GEORGE O. NINKOVICH (Hystar Aerospace Development Corp., Vancouver, Canada) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 131-137.

The Hystar airship is a flying saucerlike LTA configuration whose circular planform and propulsion system design allow it to instantaneously turn in any direction, as well as to execute VTOL operations like a hovercraft. The aircraft is presently suggested to be applicable to aerial surveillance, geophysical surveying, agricultural spraying, fishing, and logging. Size comparisons are presented for the Hystar craft and both the conventional and 'Cyclo-Crane' LTA craft for similar payloads. O.C.

A88-16662

AN OVERVIEW OF ULITA INDUSTRIES INC.

MARK R. FORSS (Ulita Industries, Inc., Sheboygan, WI) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 217-233.

Ulita Industries was formed in 1974 for the development of Light Utility Airships (LUAs), defined as nonrigid, He-filled airships ranging in size from 15,000 to 120,000 cu ft. Attention is given to the features and development status of the sport/utility UM-10, and the larger and more sophisticated LUA-1 and LUA-2 craft. The prototype control car of the LUA-1 has been constructed, and the construction of a UM-10 prototype is planned. O.C.

A88-16663

AN INTRODUCTION TO US AIRSHIP AND THE USA-100

RAY MCIVER and JIM THEO (U.S. Airship Corp., Eugene, OR) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 239-245.

A project management organization and vehicle development status report is presented for the USA-100 airship, which is about 2/3 the size of a conventional Goodyear blimp and employs only one engine for (nonvectorable) fan propulsion. Notwithstanding

these simplifications, a useful load that is comparable to that of the larger blimp is achieved. The primary application of this small nonrigid airship is in advertising. O.C.

RETOOLING CFD FOR HYPERSONIC AIRCRAFT

DOUGLAS L. DWOYER (NASA, Langley Research Center, Hampton, VA), PAUL KUTLER (NASA, Ames Research Center, Moffett Field, CA), and LOUIS A. POVINELLI (NASA, Lewis Research Center, Cleveland, OH) Aerospace America (ISSN 0740-722X), vol. 25, Oct. 1987, p. 32-35, 41.

The CFD facility requirements of hypersonic aircraft configuration design development are different from those thus far employed for reentry vehicle design, because (1) the airframe and the propulsion system must be fully integrated to achieve the desired performance; (2) the vehicle must be reusable, with minimum refurbishment requirements between flights; and (3) vehicle performance must be optimized for a wide range of Mach numbers. An evaluation is presently made of flow resolution within shock waves, transition and turbulence phenomenon tractability, chemical reaction modeling, and hypersonic boundary layer transition, with state-of-the-art CFD. O.C.

SOVIET AVIATION TECHNOLOGY'S STATE OF THE ART SU-27 FIGHTER

GONG FEI 15 Jul. 1987 12 p. Transl. into ENGLISH from Conmlit (People's Republic of China), v. 1, issue 122, 1 Jan. 1987 p 61-62

(AD-A184121; FTD-ID(RS)-T0528-87) Avail: NTIS HC A03/MF A01 CSCL 01C

The SU-27 fighter makes use of avionics equipment representing the highest current level of Soviet technology and is estimated to be comparable in its overall capabilities to third generation U.S. fighters. What is attracting peoples' interest is whether or not the SU-27 is able to undertake long range interceptor missions or has been created as a medium-type fighter for loading aboard aircraft carriers. GRA

N88-12452*# United Technologies Corp., East Hartford, Conn. **A FULL POTENTIAL FLOW ANALYSIS WITH REALISTIC WAKE INFLUENCE FOR HELICOPTER ROTOR AIRLOAD PREDICTION**

T. ALAN EGOLF and S. PATRICK SPARKS Washington NASA Jan. 1987 69 p (Contract NAS2-11150)

(NASA-CR-4007; NAS 1.26:4007; R86-915999-13) Avail: NTIS HC A04/MF A01 CSCL 01B

A 3-D, quasi-steady, full potential flow solver was adapted to include realistic wake influence for the aerodynamic analysis of helicopter rotors. The method is based on a finite difference solution of the full potential equation, using an inner and outer domain procedure for the blade flowfield to accommodate wake effects. The nonlinear flow is computed in the inner domain region using a finite difference solution method. The wake is modeled by a vortex lattice using prescribed geometry techniques to allow for the inclusion of realistic rotor wakes. The key feature of the analysis is that vortices contained within the finite difference mesh (inner domain) were treated with a vortex embedding technique while the influence of the remaining portion of the wake (in the outer domain) is impressed as a boundary condition on the outer surface of the finite difference mesh. The solution procedure couples the wake influence with the inner domain solution in a consistent and efficient solution process. The method has been applied to both hover and forward flight conditions. Correlation with subsonic and transonic hover airload data is shown which demonstrates the merits of the approach. Author

REDUCED COMPLEXITY STRUCTURAL MODELING FOR AUTOMATED AIRFRAME SYNTHESIS

PRABHAT HAJELA May 1987 79 p

(Contract NCA2-IR240-401)

(NASA-CR-177440; NAS 1.26:177440) Avail: NTIS HC A05/MF A01 CSCL 01B

A procedure is developed for the optimum sizing of wing structures based on representing the built-up finite element assembly of the structure by equivalent beam models. The reduced-order beam models are computationally less demanding in an optimum design environment which dictates repetitive analysis of several trial designs. The design procedure is implemented in a computer program requiring geometry and loading information to create the wing finite element model and its equivalent beam model, and providing a rapid estimate of the optimum weight obtained from a fully stressed design approach applied to the beam. The synthesis procedure is demonstrated for representative conventional-cantilever and joined wing configurations. Author

27TH LANCHESTER MEMORIAL LECTURE - SCALE EFFECT IN TRANSONIC FLOW

A. B. HAINES Aeronautical Journal (ISSN 0001-9240), vol. 91, Aug.-Sept. 1987, p. 291-313. refs

A history is presented of the last 35 years' development of research in the field of the scale effect in transonic flow. Much of this research is noted to have concentrated on two-dimensional flow, whose results were then applied to the prediction of three-dimensional configuration phenomena; the assumption of scale effect constancy in such extrapolations is frequently unwarranted. It is judged that present knowledge concerning such cases as moderate aspect ratio combat aircraft wings does not allow flow prediction to the degree of accuracy desired. O.C.

AN ASSESSMENT OF THE USE OF LOW-ORDER PANEL METHODS FOR THE CALCULATION OF SUPERSONIC FLOWS

J. S. SMITH and D. S. WOODWARD (Royal Aircraft Establishment, Aerodynamics Dept., Farnborough, England) (NATO, AGARD, Symposium on Applications of Computational Fluid Dynamics in Aeronautics, Aix-en-Provence, France, Apr. 7-10, 1986) Aeronautical Journal (ISSN 0001-9240), vol. 91, Aug.-Sept. 1987, p. 314-320. refs

Three low-order panel methods developed for the analysis of supersonic flows have been used to make calculations for a number of test configurations, with the aim of establishing the range of problems for which this class of computational method yields adequate solutions. The programs investigated were the Woodward USSAERO/C program, the related NLRAERO program, and the British Aerospace Warton supersonic panel program. Results obtained using these programs have been evaluated against theoretical and experimental data for a number of test cases covering wing-alone, body-alone and wing-body geometries. It is concluded that low-order panel methods can provide adequate solutions for supersonic flows about wings, bodies and wing-body combinations, provided the assumptions implicit in the linearized potential flow model are not violated. Examples show that the prediction of lift and pitching moment curve slopes for quite complex configurations may be acceptable, but that the detailed pressure distributions are not always predicted satisfactorily. In particular, serious problems are encountered in calculating the flow about

02 AERODYNAMICS

wings with rounded supersonic leading edges due to the linearized flow model which is used. Author

A NUMERICAL MODEL FOR ANALYSIS OF THIN WINGS IN INVISCID INCOMPRESSIBLE FLOW

B. K. SINGH and B. C. BASU (Indian Institute of Technology, Kharagpur, India) Aeronautical Journal (ISSN 0001-9240), vol. 91, Aug.-Sept. 1987, p. 333-337. refs

A planar vortex sheet model for analysis of thin wings in inviscid incompressible flow is presented. In this model a network of spanwise quadratically varying semi-infinite doublet sheets is introduced which produces a continuous trailing vortex wake. The present method has been applied to wings fitted with partial span trailing edge flaps after appropriate modification to account for the flap juncture. Also, the problem of wings in sideslip is attempted by incorporating the zero load condition at the down stream wing tip. The comparison of results shows that the proposed model retains the simplicity of the vortex lattice model to a large extent while overcoming the limitations of the standard vortex lattice model regarding lattice arrangement and number. FREE-WAKE ANALYSIS OF HELICOPTER ROTORS - A BOUNDARY ELEMENT APPROACH

B. K. BHARADVAJ and L. MORINO (Boston University, MA) IN: Betech 86; Proceedings of the Second Boundary Element Technology Conference, Cambridge, MA, June 17-19, 1986. Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, p. 291-303. refs (Contract DAAG29-83-K-0050)

A simple and direct BEM analysis of unsteady viscous external flow is presented which is based on the classical decomposition of Helmholtz. The vorticity evolution equation is solved using a method involving material contravariant components. Results obtained with the method for the case of the free wake of helicopter rotors in hover are found to be in good agreement with previous experimental data, the generalized wake (which is also based on experimental data), and computational results derived using a generalized wake approach. The method has application to the flow past bodies in arbitrary motion, and it can easily be extended to the case of rotors in forward flight. R.R.

AERODYNAMIC ANALYSIS OF COMPLICATED THREE-DIMENSIONAL CONFIGURATIONS USING SURFACE PANEL METHODS

J. L. HESS (Douglas Aircraft Co., Long Beach, CA) IN: Betech 86; Proceedings of the Second Boundary Element Technology Conference, Cambridge, MA, June 17-19, 1986. Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, p. 305-318. refs

The development of surface panel methods for the BEM analysis of complicated aerodynamic flow situations is reviewed, and recent applications in fields including aeronautics and automotive engineering are considered. With these methods the body is discretized by means of a large number of small plane quadrilateral panels on which the source and/or dipole strength is distributed in some fashion. It is noted that when large numbers of panels are employed, approximate expressions must be used for the influences of distant panels, and an iterative solution must be applied in solving linear equations. Specific applications of the panel method for the analysis of bodies such as transport aircraft propellers, surface ships, and underwater structures are discussed. R.R.

A88-13267

A HIGH ORDER PANEL METHOD FOR DETERMINING INCOMPRESSIBLE FLOWS AROUND ARBITRARY BODIES

Z. P. NOWAK (Warszawa, Politechnika, Warsaw, Poland) IN: Betech 86; Proceedings of the Second Boundary Element Technology Conference, Cambridge, MA, June 17-19, 1986. Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, p. 319-327. refs

A higher-order boundary integral method for solving the exterior Neumann problem for the Laplace equation is proposed, with application to incompressible potential flows around three-dimensional bodies. The body is approximated by a closed polyhedron composed of plane triangular panels, and accurate and efficient flow velocity calculations are obtained by differentiating a bicubic spline fit to the potential values at the polyhedron vertices. Results are presented for the flow around a sphere and for the symmetric flow around an RAE wing with a NACA 0012 cross section. Pressure distributions on the surface of the wing are found to agree with previous results. R.R.

A BOUNDARY ELEMENT METHOD FOR UNSTEADY VISCOUS FLOWS

B. K. BHARADVAJ, L. MORINO, and S. DEL MARCO (Boston University, MA) IN: Betech 86; Proceedings of the Second Boundary Element Technology Conference, Cambridge, MA, June 17-19, 1986. Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, p. 421-430. refs (Contract NAG1-564)

A potential vorticity method for the analysis of unsteady viscous incompressible flow past arbitrarily shaped objects is discussed which is based on the Helmholtz decomposition. It is found that the correct boundary condition to be imposed is on the normal component of the velocity for the cases of both inviscid and viscous flows. The no-slip condition is shown to be automatically satisfied for viscous flows. Numerical solutions for two-dimensional flow problems are given for attached flows in addition to those involving separation. The vorticity is confined, at least for the case of symmetric flows, to a small region in the immediate vicinity of the body, making possible the minimization of the number of node points in the field, and hence the computational time, without loss of accuracy. R.R.

FLOW AROUND A CONE AT SUPERSONIC SPEED

DUN HUANG (Beijing University, People's Republic of China) IN: Progress in applied mechanics. Dordrecht, Martinus Nijhoff Publishers, 1987, p. 83-89. refs

The inviscid supersonic conical flow around a cone at zero angle of attack is analyzed by the method of asymptotic expansion. The two kinds of parameter used are both small differences of angles. Asymptotic expansions up to the fourth order are obtained, and a comparison with the Table of Conical Flow (Kopal, 1947) is added. Comparison shows that for adequately high Mach number of incoming flow, the result of this paper is correct to four significant figures. Some possible applications are indicated. Author

Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1986, p. 146-171. In German. Sponsorship: Bundesministerium der Verteidigung. (Contract BMVG-T/RF-41/D0011/D1411)

The aerodynamic characteristics of a series of double delta wings under asymmetric flow conditions were investigated. Results are given for three wings with aspect ratios of 1.31, 2.05, and 3.01. While the geometry of the wing front section was kept constant, the sweepback angle of the rear section was systematically varied. The site of the break of the curve at the front edge was kept constant. The wings were treated as flat plates with rounded front edges. Six-component, pressure distribution, and flow field measurements are presented, and the visibility of the wall flow line is examined. The physical flow process is discussed, and the results are compared with theoretical findings. C.D.

Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1986, p. 172-191. In German.

(Contract DFG-HU-254/8)

Preliminary results are presented of an experimental study of the interference between guidance and wings in closely-coupled duck configurations in incompressible and symmetric flow. Results of three-component measurements and findings on the suction-side pressure distributions are given and discussed. Pressure distributions for various angles of attack are given and the near-wall flow process is examined using wall shear stress pictures. The results show that a strong influence of the guidance on the wings retards flow separation at the front edge and increases in the rear area. The influence of the wings on the guidance increases with increasing angle of attack, inducing upwash and parallel winds. These results are compared with wind tunnel test results of the interference between guidance and wings. C.D.

NUMERICAL SOLUTIONS OF THE EULER EQUATIONS FOR THE FLOW FIELD AROUND COUNTER-ROTATING PROPELLERS

MAKOTO KOBAYAKAWA and MASAHIRO NAKAO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 35, no. 403, 1987, p. 389-398. In Japanese, with abstract in English. refs

In order to investigate the flow field around the ATP through numerical methods for its optimal design, 3D-Euler equations are most prominent. The flow field around counterrotating propellers in advancing 0.8 Mach is obtained. Two spaces including front and rear blades are solved separately. The interaction between both blades are taken into the calculation by the connecting surfaces. The noniterative implicit ADI scheme is used in order to solve Euler equations. The periodic steady and averaged steady solutions are obtained. The latter is simplified by averaging the variables at the connecting surface. This shortens the calculation time to one-third compared with the periodic steady analysis which simulates the relative motion of the blades exactly. Numerical calculations are performed for two counter rotating ATP's with SR-1 and SR-3 blades. Both results show that they are similar to each other, and the propeller efficiencies increase compared with single rotating ATP with same blades. Author

A DESIGN OF THE CASCADE FOR A SHOCK-IN-ROTOR SUPERSONIC AXIAL-FLOW COMPRESSOR

TAKAAKI HASHIMOTO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 35, no. 403, 1987, p. 401-404. In Japanese, with abstract in English. refs

A design method of the cascade for a shock-in-rotor supersonic axial-flow compressor is presented. The inlet flow is uniform and satisfies simplified radial equilibrium. The flow just before the normal shock is uniform and satisfies simplified radial equilibrium. The supersonic portion between the inlet and the normal shock is designed by using the method of weak wave. In the subsonic portion the flow is quasi-axisymmetric. The shape of mean streamline is assumed to be circular arc. The passage walls are composed of circular arcs. A two-dimensional supersonic cascade which is designed by the method in this report includes the three-dimensional effect by taking into account radial equilibrium conditions. Author

AN EXPERIMENTAL STUDY OF THE STABILITY OF A SUPERSONIC BOUNDARY LAYER ON A CONE [EKSPERIMENTAL'NOE ISSLEDOVANIE USTOICHIVOSTI SVERKHZUKOVOGO POG-RANICHNOGO SLOIA NA KONUSE]

A. D. KOSINOV, A. A. MASLOV, and S. G. SHEVEL'KOV (AN SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR) Akademiia Nauk SSSR, Sibirskoe Otdelenie, Izvestiia, Seriya Tekhnicheskii Nauki (ISSN 0002-3434), Aug. 1987, p. 64-69. In Russian. refs

An experimental study is made of the stability of a supersonic boundary layer on a cone against both natural and artificial perturbations. The spatial characteristics of the wave perturbation field of a supersonic boundary layer on a cone are determined, and it is shown that the evolution of perturbations on a cone is similar to the development of perturbations in a boundary layer on a flat plate. It is suggested that the difference in the Reynolds number of the transitions on a cone and on a plate may be due to both the lesser degree of the spatial amplification of perturbations on a cone and the difference in the nature of perturbation generation. MODELING OF LARGE-SCALE VORTEX STRUCTURES IN SUPERSONIC TURBULENT FLOW PAST BLUNT BODIES [MODELIROVANIIE KRUPNOMASSHTABNYKH VIKHREVYKH STRUKTUR PRI TURBULENTNOM OBTEKANII ZATUPLENNYKH TEL SVERKHZUKOVYIM POTOKOM]

I. A. BELOV, S. A. ISAEV, V. N. KONOVALOV, and A. I. MITIN (Leningradskii Mekhanicheskii Institut, Leningrad, USSR) Akademiia Nauk SSSR, Sibirskoe Otdelenie, Izvestiia, Seriya Tekhnicheskii Nauki (ISSN 0002-3434), Aug. 1987, p. 101-107. In Russian. refs

Large-scale vortex structures formed in supersonic flow past a cylinder, with a needle and a disk mounted in front of it, are modeled numerically and physically using the concept of an inviscid compressible gas with a specified turbulent shear layer at the separation zone boundary. A full system of Reynolds and energy equations is used for the mixing layer; the system is closed by a convective turbulence model. Parametric calculations are carried out to determine the effect of the body geometry and incoming flow Mach number on the wave drag coefficient and static pressure profiles at the cylinder end. The results obtained show that the approach proposed here is capable of correctly reproducing separated flow past a body. V.L.

AN UNSTEADY LIFTING-LINE THEORY

P. D. SCLAVOUNOS (MIT, Cambridge, MA) Journal of Engineering Mathematics (ISSN 0022-0833), vol. 21, no. 3, 1987, p. 201-226. Navy-supported research. refs
(Contract NSF MEA-82-10649-A01)

A lifting-line theory is developed for wings of large aspect ratio undergoing time-harmonic oscillations, uniformly from high to low frequencies. The method of matched asymptotic expansions is used to enforce the compatibility of two approximate solutions valid far from and near the wing surface. The far-field velocity potential is expressed as a distribution of normal dipoles on the wake, and its expansion near the wing span leads to an expression for the oscillatory downwash. The near-field flow is two-dimensional. A particular solution is obtained from strip theory and a homogeneous component is added to account for the spanwise hydrodynamic interactions. The compatibility of the inner and outer solutions leads to an integral equation for the distribution of circulation along the wing span. In the zero-frequency limit it reduces to that in Prandtl's lifting-line theory, and for high frequencies it tends to the two-dimensional strip theory. Lift computations are presented for an elliptic and a rectangular wing of aspect ratio $A = 4$. Author

THE THEORETICAL MODEL AND NUMERICAL SOLUTION FOR THE COMPRESSIBLE VISCOUS VORTEX CORES

BINGQIU LIN (Beijing Institute of Aerodynamics, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 5, Sept. 1987, p. 235-243. In Chinese, with abstract in English. refs

Based on the dimensional analysis, the parabolic equation of a compressible viscous vortex core has been derived. A simpler numerical method described here can be used to calculate the subsonic, transonic, and supersonic vortex motions. Numerical results for two examples are also shown, one for the expanding motion of the stable vortex and the other for the contracting motion of the stable vortex. Author

A MIXED DIRECT-INVERSE PROBLEM OF THE TRANSONIC CASCADE

WEI LIU (Beijing Institute of Aerodynamics, People's Republic of China) and MENGJU SHEN (Tsinghua University, Beijing, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 5, Sept. 1987, p. 244-250. In Chinese, with abstract in English. refs

A computational method is used to solve the mixed direct-inverse problem of a transonic plane cascade. It is based on the finite volume method and solves Euler equations directly. In effect the flow field in which shocks exist can be studied. The present method can be used in a wider range than the transonic relaxation method. K.K.

ZERO-LIFT DRAG PREDICTIONS IN SUPERSONIC FLOW FOR COMPLEX CONFIGURATIONS

QIDE YANG and MINGSHENG MA (China Aerodynamic Research and Development Centre, Mianyang, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 5, Sept. 1987, p. 293-297. In Chinese, with abstract in English. refs

A supersonic zero-lift drag computer program was developed for complex missile-like body shapes. A mixed method was developed for wave drag prediction. Van Dyke's (1952) second-order perturbation theory is used to compute the pressure distribution and resulting wave drag of the main body. The wave drag of the complete configuration is obtained via the product of the wave drag of the main body and the interference factors. K.K.

THE CALCULATION OF AEROFOIL FRICTION DRAG IN COMPRESSIBILITY VISCOUS FLOW

JIA XIANG YAN, ZHIDE QIAO, and YONG YANG (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 5, Sept. 1987, p. 306-310. In Chinese, with abstract in English. refs

The calculation method of the aerofoil friction drag in a compressibility viscous flow is studied in this paper, including the calculation of the laminar boundary layer in the front of the aerofoil by the modified Thwaites (1949) method and the calculation of turbulent boundary layer by Green's (1972) method. According to these methods, two aerofoil drag coefficients have been calculated under different Reynolds numbers and Mach numbers. Author

SUPERCOMPUTING OF SUPERSONIC FLOWS USING UPWIND RELAXATION AND MACCORMACK SCHEMES

O. BAYSAL (Old Dominion University, Norfolk, VA) IN: Applications of parallel processing in fluid mechanics; Proceedings of the Applied Mechanics, Bioengineering, and Fluids Engineering Conference, Cincinnati, OH, June 14-17, 1987. New York, American Society of Mechanical Engineers, 1987, p. 27-35. refs
(Contract NAG1-664)

The performance of two numerical solution schemes, (1) an implicit upwind relaxation with a finite-volume discretization (Thomas and Walters, 1985) and (2) an explicit-implicit

MacCormack (1981) scheme with a finite-difference discretization, is compared in two-dimensional simulations of supersonic flow past a flat plate with leading edge, a rearward-facing step, a 10-deg compression corner, a NACA 0012 airfoil at high angle of attack, and a cavity. The algebraic turbulence model, the solution methods, and the boundary conditions and SIMD coding are explained, and the results are presented in tables and graphs and characterized with reference to published experimental data. Scheme (1) is found to converge more rapidly and to give more accurate results than (2) in a wide range of problem types. T.K.

PERFORMANCE OF A THREE-DIMENSIONAL NAVIER-STOKES CODE ON CYBER 205 FOR HIGH-SPEED JUNCTURE FLOWS
 B. LAKSHMANAN and S. N. TIWARI (Old Dominion University, Norfolk, VA) IN: Applications of parallel processing in fluid mechanics; Proceedings of the Applied Mechanics, Bioengineering, and Fluids Engineering Conference, Cincinnati, OH, June 14-17, 1987. New York, American Society of Mechanical Engineers, 1987, p. 65-74. refs
 (Contract NAS1-53003)

A vectorized 3D Navier-Stokes code has been implemented on CYBER 205 for solving the supersonic laminar flow over a swept fin/flat plate junction. The code extends MacCormack's predictor-corrector finite volume scheme to a generalized coordinate system in a locally one dimensional time split fashion. A systematic parametric study is conducted to examine the effect of fin sweep on the computed flow field. Calculated results for the pressure distribution on the flat plate and fin leading edge are compared with the experimental measurements of a right angle blunt fin/flat plate junction. The decrease in the extent of the separated flow region and peak pressure on the fin leading edge, and weakening of the two reversed supersonic zones with increase in fin sweep have been clearly observed in the numerical simulation. COMPUTATION OF SUBSONIC BASE FLOW ON A VECTOR PROCESSOR

D. H. RUDY (NASA, Langley Research Center, Hampton, VA) IN: Applications of parallel processing in fluid mechanics; Proceedings of the Applied Mechanics, Bioengineering, and Fluids Engineering Conference, Cincinnati, OH, June 14-17, 1987. New York, American Society of Mechanical Engineers, 1987, p. 75-83. refs

Two-dimensional subsonic laminar compressible base flow has been studied using numerical solutions of the time-dependent Navier-Stokes equations. These solutions were obtained using an explicit finite-difference scheme which is highly efficient on a vector processor. The organization of the code for a CDC CYBER-205 computer is described. Solutions were obtained for Mach 0.4 and 0.6 flows past a slender blunt-based model at moderately high Reynolds numbers. The flow in the wake is unsteady with periodic shedding of vortices from the trailing edge. The computed shedding frequency was found to increase with increasing Reynolds number. Author

COMPUTATIONS OF A TURBULENT JET-EDGE FLOW FIELD
 P. S. BERNARD (Maryland, University, College Park) IN: Forum on Turbulent Flows - 1987, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 13-17. refs

Recent studies have elucidated the underlying vortical structure of a self-excited oscillatory jet impinging on a sharp edged wedge under laminar conditions. The present work analyzes this system at a Reynolds number, $R = 2000$, for which turbulent phenomena are expected to be present and of significance. Numerical solutions to the closed system of equations constituting the Mean Vorticity and Covariance closure were obtained using a vectorizable algorithm on a CRAY XMP/48 supercomputer. The observed pattern of vortical events in front of the wedge tip differed significantly from lower Reynolds number solutions. The dynamically

important wedge tip and nozzle lip regions were the sites of most intense turbulence activity. Stage 2 behavior characterized the dominant motions of the jet while an intermittent high frequency oscillation was also observed. This may be a precursor to the stage 3 type flow which is expected near the simulation Reynolds number. Author

INTERACTIONS OF A TWO-DIMENSIONAL VORTEX WITH A WALL LAYER OF VORTICITY

R. W. BARTHOLOMEW, K. PAN, and S. M. BAJOREK (Michigan State University, East Lansing) IN: Forum on Turbulent Flows - 1987, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 25-30. refs

The interaction of a two-dimensional vortex linepair with a wall layer of vorticity was studied using a vortex-in-cell computation. The interactions, ranging from mild disturbances to violent rearrangements of the wall layer vorticity, are characterized using three dimensionless parameters: the angle at which the vortex linepair is introduced, the ratio of the length scales for the linepair and the wall layer thickness, and the ratio of the characteristic velocities. The nature of the interactions are illustrated through comparisons with vortex ring/wall experiments and by vector velocity plots which show the rollup of wall layer fluid, the formation of depressions in the vorticity layer, and/or the breakup of the vortex linepair. These three phenomena all have analogs in the bursting process of turbulent boundary layers. Thus, while the two-dimensional model lacks the vortex stretching of a truly turbulent boundary layer, the model proves itself a valuable tool for gaining insight into a number of phenomena associated with the turbulent production process. CALCULATION OF WALL AND FREE TURBULENT-SHEAR FLOWS AT SUPERSONIC SPEEDS

O. BAYSAL and S. SRINIVASAN (Old Dominion University, Norfolk, VA) IN: Forum on Turbulent Flows - 1987, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 55-60. refs
 (Contract NAG1-664)

Supersonic turbulent flows are simulated numerically by solving the Reynolds-averaged full Navier-Stokes equations by an implicit finite-volume method. This flux-vector-split upwind scheme uses approximate factorization followed by line-Gauss-Seidel relaxations. The effects of turbulence are modeled by two eddy viscosity models. High-Reynolds-number form of the k-epsilon model is coupled with a wall-function to avoid excessive refinement of the grid in the low-Reynolds number regions. The k-epsilon equations are solved by the explicit-implicit MacCormack method. The algebraic Baldwin-Lomax model is also being used as an inexpensive alternative for the cases which do not experience massive separation. Several examples of two-dimensional solutions are given to illustrate both wall and free turbulent shear flows which include fluid dynamic phenomena, such as shocks, boundary layers, shear layers, wakes, separations and recirculations. The results compared with experimental data show good agreement. Author

RESPONSE OF A DELTA WING IN STEADY AND UNSTEADY FLOW

M. LEE, CHIANG SHIH, and CHIH-MING HO (Southern California, University, Los Angeles, CA) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 19-24. refs
 (Contract F49620-85-C-0080)

This paper is concerned with the response of a delta wing under periodic acceleration and deceleration of the free stream velocity. The experiments were carried out in a vertical water channel where the free stream velocity was varied close to a triangular pattern. Flow visualizations indicated that the leading edge vortex on top of the delta wing was not drastically affected

by the imposed unsteady free stream. Lift measurements suggested that the unsteady lift coefficient followed the variation of the time derivative of the free stream velocity. Author

VORTEX DYNAMICS OF SLENDER WINGS AS A NUMERICAL EXPERIMENT WITH DISCRETE-VORTEX METHODS

H. K. CHENG and Z. X. JIA (Southern California, University, Los Angeles, CA) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 35, 36. refs
(Contract AF-AFOSR-85-0318)

The problem of an unsteady, massively separated flow about a flat plate at normal incidence is numerically investigated with discrete-vortex methods in order to study the vortex dynamics of a slender delta wing. For the case of a uniformly expanding plate corresponding to a flat delta wing, the present solution is shown to accurately recover the conical-flow symmetry. Good agreement is found with corresponding data for a delta wing in steady flow obtained using Euler and potential codes. R.R.

STEADY AND UNSTEADY AERODYNAMIC INTERFERENCE IN CLOSELY COUPLED CANARD/WING CONFIGURATIONS

J. ELZEBDA, D. T. MOOK, and A. H. NAYFEH (Virginia Polytechnic Institute and State University, Blacksburg) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 37-44. refs

A versatile method based on the general unsteady vortex-lattice technique was developed in a previous paper. This method models flows over an arbitrary number of lifting surfaces. Further use of this method is considered in this paper. The X-29 (two canards and main wing) is used as a model, and simulations of the steady and unsteady aerodynamic interference are presented. A comparison of the static aerodynamic load with wind-tunnel data shows good agreement. The present investigation also yields the time histories of the aerodynamic loads on the lifting surfaces for a sinusoidal motion. The results show the strong influence of the canards on the main wing, including the time lag between the motion of the canards and the subsequent changes in the pressure distributions and loads on the main wing. NUMERICAL SIMULATION OF SELF-SUSTAINED AND FORCED OSCILLATIONS IN JET SHEAR LAYERS

J. N. SCOTT (Dayton, University, OH) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 123-130. refs
(Contract NAG3-526)

Excitation of axisymmetric jet shear layers has been investigated by solving the time-dependent compressible Navier-Stokes equations. McCormack's explicit finite difference scheme is used in performing the computations on a CRAY X-MP computer. This work examines the influence of various means of excitation of the shear layer, to produce large scale vortex structures in such a manner that the mixing between two flows

will be enhanced or diminished. While successful pressure excitation has been achieved in previous studies only limited success with temperature excitation at the inflow boundary has been accomplished. The current study focuses on the use of temperature excitation through the boundary layer immediately inside the jet lip. In order to achieve the required resolution significant grid refinement is necessary. The results of the computation with and without temperature excitation are analyzed and compared with results obtained using pressure excitation. The influence of amplitude and frequency on specific flow characteristics are also examined. The excitation frequency for both the temperature and pressure corresponds to a Strouhal number of .45 and the inflow jet Mach number is approximately .3. Author

DETAILS OF THE COMPUTED FLOWFIELD OVER A CIRCULAR CYLINDER AT REYNOLDS NUMBER 1200

C. L. RUMSEY (NASA, Langley Research Center, Hampton, VA) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 175-185. refs

The application of an upwind-biased implicit approximate factorization Navier-Stokes algorithm to the unsteady impulsive start-up flow over a circular cylinder at Reynolds number 1200 is described. The complete form of the compressible Navier-Stokes equations is used, and the algorithm is second-order accurate in both space and time. The development with time of the shape and size of the separated vortical flow region is computed, as well as the time-variation of several boundary layer parameters and profile shapes. Computations, in general, show excellent agreement with experiment, although the present method predicts a more rapid onset of reversed flow on the cylinder than evidenced in experiment. The changes that the vortical region behind the cylinder undergoes as the symmetric flow transitions to periodic vortex shedding are discussed. The flow becomes periodic with a Strouhal frequency of 0.222, which compares well with the experimental value of approximately 0.21. The effect of grid density on the development of the unsteady flow is also shown. Author

FEATURES OF TRANSITIONAL SEPARATION BUBBLES IN AN OSCILLATING FREESTREAM

M. BRENDL and T. J. MUELLER (Notre Dame, University, IN) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 191-197. Research supported by the University of Notre Dame. refs
(Contract N00014-83-K-0239)

Wind tunnel experiments were conducted to study the transitional separation bubbles on an airfoil in steady and streamwise unsteady flow. Hot-wire anemometry data were obtained on a FX63-137 airfoil operating with a mean chord Reynolds number of 100,000. A programmable damper system was used to produce a streamwise periodic variation in the wind tunnel speed. Mean unsteady and phase-locked velocity profiles

02 AERODYNAMICS

were obtained for a base flow having an oscillation period of 0.5 seconds and an amplitude of 7 percent of the mean flow. The mean unsteady displacement thicknesses in the separated laminar shear layer of the transitional bubble were lower than the steady values while the mean unsteady momentum thicknesses did not show measureable differences. THE EFFECT OF PITCH LOCATION ON DYNAMIC STALL

E. J. JUMPER (USAF, Institute of Technology, Wright-Patterson AFB, OH), R. L. DIMMICK (USAF, Wright-Patterson AFB, OH), and A. J. S. ALLAIRE (Canadian Armed Forces, Canada) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 201-208. refs

A theoretical and wind tunnel investigation of the effect of pitch location on dynamic stall is presented for an airfoil pitching at constant rate. Theoretical data were obtained using a modified momentum-integral method, and experimental time-varying pressure data were obtained from 16 locations on an NACA 0015 airfoil. The data were used to determine dynamic-stall effects of change in the angle of attack at which separation occurs at the quarter chord, and change in the angle of attack at which stall occurs. The results indicate a nondimensional pitch rate given by the chord times the pitch rate divided by two times the freestream velocity. R.R.

FLOW DEVELOPMENT ON A JOUKOWSKI AIRFOIL STARTED IMPULSIVELY FROM REST

R. ROJAS-OVIEDO and J. C. WILLIAMS, III (Auburn University, AL) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 209-214. Research supported by the Instituto Politecnico Nacional and Auburn University. refs

A study is made of the unsteady laminar boundary layer development on a symmetrical Joukowski airfoil at zero angle of attack, impulsively set into uniform motion. The boundary layer development is calculated using an implicit finite difference technique. Special attention is paid to the growth of the boundary layer near the airfoil trailing edge and to the nature of the separation singularity. It is shown that as time increases a bubble of recirculating fluid forms near the trailing edge, increases size as time increases, until finally it extends beyond the trailing edge of the airfoil. The computed characteristics of the boundary layer support the concept of a spontaneous singularity at separation which appears at a dimensionless time of approximately 4.3 at approximately 0.7 chord. From this point the separation moves fairly rapidly to the steady state separation point at approximately .500 chord. The effects of certain numerical parameters on the numerical calculation and on the computed boundary layer characteristics are also investigated. Author

ON STEADY SUPERSONIC FLOW OVER TWO-DIMENSIONAL AIRFOILS

HAMDI T. HEMDAN (King Saud University, Riyadh, Saudi Arabia) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 30, Aug. 1987, p. 111-129. Research supported by King Saud University. refs

The problem of steady supersonic flow over two-dimensional airfoils with attached shock waves is considered. By combining the Newtonian limit with a geometric limiting process, new approximate equations are derived which can be used for a wide range of supersonic flows. Newtonian flow can be recovered from those equations as a special case. The work is restricted to moderate supersonic flow only for which two systems of linearized equations are derived and used to obtain closed-form formulas for the coefficient of surface pressure and other aerodynamic parameters. The results are compatible with the theory of characteristics and experiments and improve over other existing approximate methods. Author

A FAST APPROACH TO DESIGNING AIRFOILS FROM GIVEN PRESSURE DISTRIBUTION IN COMPRESSIBLE FLOWS

PRABIR DARIPA (New York University, NY) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 8 p. refs
(Contract NSG-1617; AF-AFOSR-83-0336; DE-AC02-76ER-03007) (AIAA PAPER 87-2862)

A new inverse method for aerodynamic design of airfoils is presented for subcritical flows. The pressure distribution in this method can be prescribed as a function of the arc length of the as-yet unknown body. This inverse problem is shown to be mathematically equivalent to solving only one nonlinear boundary value problem subject to known Dirichlet data on the boundary. The solution to this problem determines the airfoil, the freestream Mach number, and the upstream flow direction. The existence of a solution to a given pressure distribution is discussed. The method is easy to implement and extremely efficient. A series of results for which comparisons are made with the known airfoils is presented. Author

AN EXPERIMENTAL INVESTIGATION OF WING/FUSELAGE INTEGRATION GEOMETRIES

MARK D. MAUGHMER (Pennsylvania State University, University Park) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 10 p. refs
(AIAA PAPER 87-2937)

Although long recognized as a significant contributor to overall drag, a great deal of work yet remains to be done on understanding and controlling the interference flowfield generated by the wing/fuselage intersection. As the increasing use of composite structures allows more and more complicated geometries to be realized, the possibility exists for the very careful blending of the wing/fuselage region such that the impact of the juncture on the flow is minimized. Specifically, it is found that a leading-edge extension of the airfoil in the vicinity of the wing root decreases the size and strength of the vortex which generally forms in this region. To investigate such wing/fuselage integration, an experimental program has been performed in which flow visualization, pressure distributions, and force-balance data were obtained and used to define the most promising juncture geometries. These experiments indicate that the juncture flow is very sensitive to the wing/fuselage intersection geometry, and the proper shaping of this region can lead to a significant drag reduction. Author

AIRSHIP LIFT - STATIC, DYNAMIC AND POWERED STATIC

DONALD M. LAYTON (U.S. Naval Postgraduate School, Monterey, CA) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 1. London, Royal Aeronautical Society, 1986, p. 7.1 to 7.14. refs

A comprehensive evaluation is made of the consequences for airship lift performance, maneuverability, and aerodynamic efficiency of the various modes of interaction between basic static lift capacity and both propulsion system-generated lift and incidence in forward motion-induced dynamic lift. It was demonstrated as far back as the 1920s that a classic airship hull generates less than 20 percent of the dynamic lift obtainable at incidence; the rest comes from the horizontal fins and stabilizers. Attention is given to the effects of lift gas superheating and the usefulness of negative dynamic lift in maintaining equilibrium flight. O.C.

ORGANIZED STRUCTURES IN A COMPRESSIBLE, TURBULENT BOUNDARY LAYER

ERIC F. SPINA and ALEXANDER J. SMITS (Princeton University, NJ) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 182, Sept. 1987, p. 85-109. refs
(Contract AF-AFOSR-85-0126)

The boundary layer behavior of a compressible flow was studied using a high-Reynolds-number supersonic blowdown wind tunnel. Four miniature differential pressure transducers were used to measure wall-pressure fluctuations, while constant-temperature hot-wire anemometers were used to measure the instantaneous mass flux. The results show qualitative similarity between the compressible boundary layer and the incompressible flows investigated previously. It was found that large-scale structures exist in the boundary layer, with heights comparable to the boundary-layer thickness. The structures maintain their shape as they travel downstream. The angle of 45 deg inferred from correlations between two hot wires, and between a hot wire and a wall-pressure transducer, indicates that the average structure is inclined at approximately 45 deg to the wall. This result agrees well with observations of structures in schlieren photographs of supersonic boundary layer. I.S.

EFFECT OF ACOUSTIC EXCITATION ON THE FLOW OVER A LOW-RE AIRFOIL

K. B. M. Q. ZAMAN (NASA, Lewis Research Center, Cleveland, OH), A. BAR-SEVER (NASA, Langley Research Center, Hampton, VA), and S. M. MANGALAM (NASA, Langley Research Center; AS & M, Inc., Hampton, VA) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 182, Sept. 1987, p. 127-148. refs
(Contract NAS1-17670; NAS1-17683)

Wind-tunnel measurements of lift, drag, and wake velocity spectra were carried out under (tonal) acoustic excitation for a smooth airfoil in the chord-Reynolds-number $Re(c)$ range of 40,000-140,000. The data were supported by smoke-wire flow-visualization pictures. Small-amplitude excitation in a wide, low-frequency range is found to eliminate laminar separation that otherwise degrades the airfoil performance at low $Re(c)$ near the design angle of attack. Excitation at high frequencies eliminates a prestall, periodic shedding of large-scale vortices. Significant improvement in lift is also achieved during poststall, but with large-amplitude excitation. Wind-tunnel resonances strongly influence the results, especially in cases requiring large amplitudes. Author

EXPERIMENTAL STUDY OF THREE SHOCK WAVE/TURBULENT BOUNDARY LAYER INTERACTIONS

ALEXANDER J. SMITS and KIN-CHOONG MUCK (Princeton University, NJ) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 182, Sept. 1987, p. 291-314. refs
(Contract NAGW-240; AF-AFOSR-85-0126)

The paper presents a systematic study of the supersonic flow of a turbulent boundary layer over several compression-corner models. The wind tunnel and the compression-corner models (ramps fitted with aerodynamic fences to minimize three-dimensional effects) were identical with those used by Settles et al. (1979); constant-temperature hot-wire anemometry was used for the mass-flow measurements. The turning angles used for the compression corners were 8, 16, and 20 deg. In all three flow cases, the shock wave/turbulent flow interaction did amplify the turbulent stresses dramatically, with amplification increasing with increasing turning angle. However, different stress components were amplified by different amounts. I.S.

HYDRODYNAMIC CHARACTERISTICS OF A RIGID RECTANGULAR OSCILLATING WING [O GIDRODINAMICHESKIKH KHARAKTERISTIKAKH ZHESTKOGO PRIAMOUGOL'NOGO KOLEBLIUSHCHEGOSIA KRYLA]

V. N. GLUSHKO (AN USSR, Institut Gidromekhaniki, Kiev, Ukrainian SSR) Gidromekhanika (ISSN 0367-4088), no. 56, 1987, p. 43-47. In Russian. refs

Experimental setup and procedure are described which have been used to measure the hydrodynamic thrust developed by a rigid rectangular oscillating wing, NACA-0015, over a wide range of hydrodynamic characteristics under conditions of reversed motion. The effect of angular and transverse wing oscillations on the hydrodynamic thrust is examined. Expressions are presented which relate the hydrodynamic thrust to the wing oscillation frequency and incoming flow velocity. V.L.

THE GOERTLER INSTABILITY ON AN AIRFOIL

S. M. MANGALAM (Old Dominion University, Norfolk, VA), J. R. DAGENHART, J. F. MEYERS (NASA, Langley Research Center, Hampton, VA), and T. E. HEPNER (U.S. Army, Army Aviation Research and Development Command, Hampton, VA) AIAA, Aerospace Sciences Meeting, 23rd, Reno, NV, Jan. 14-17, 1985. 10 p. refs
(Contract NAG1-353)
(AIAA PAPER 85-0491)

Goertler vortices arise in boundary layers along concave surfaces due to centrifugal effects. This paper presents some results of an experiment conducted to study the development of these vortices on an airfoil with a pressure gradient in the concave region where an attached laminar boundary layer was insured with suction through a perforated panel. The sublimating chemical technique was used to visualize Goertler vortices and the velocity field was measured by laser velocimetry. The vortex wavelength clearly varied with Goertler number as predicted by linear theory. Both flow visualization and velocity measurements indicated vortex damping in the convex zone. Secondary instability was observed at the higher Goertler numbers. Author

A PERSPECTIVE OF COMPUTATIONAL FLUID DYNAMICS

PAUL KUTLER (NASA, Ames Research Center, Moffett Field, CA) IN: BAIL IV; Proceedings of the Fourth International Conference on Boundary and Interior Layers - Computational and Asymptotic Methods, Novosibirsk, USSR, July 7-11, 1986. Dun Laoghaire, Ireland, Boole Press, 1986, p. 332-348. Previously announced in STAR as N86-28057. refs

Computational fluid dynamics (CFD) is maturing, and is at a stage in its technological life cycle in which it is now routinely applied to some rather complicated problems; it is starting to create an impact on the design cycle of aerospace flight vehicles and

02 AERODYNAMICS

their components. CFD is also being used to better understand the fluid physics of flows heretofore not understood, such as three-dimensional separation. CFD is also being used to complement and is being complemented by experiments. In this paper, the primary and secondary pacing items that govern CFD in the past are reviewed and updated. The future prospects of CFD are explored which will offer people working in the discipline challenges that should extend the technological life cycle to further increase the capabilities of a proven demonstrated technology.

DESIGN OF THREE-DIMENSIONAL SCRAMJET INLETS FOR HYPERSONIC PROPULSION

J. M. SIMMONS (Queensland, University, Brisbane, Australia) and E. H. WEIDNER (NASA, Langley Research Center, Hampton, VA) IN: National Space Engineering Symposium, 2nd, Sydney, Australia, Mar. 25-27, 1986, Preprints. Volume 1. Barton, Australia/Brookfield, VT, Institution of Engineers, Australia/Brookfield Publishing Co., 1986, 10 p. refs
(Contract NAGW-674)

The paper outlines an approach to the design of three-dimensional inlets for scramjet engines. The basis of the techniques used is the method of streamline tracing through an inviscid axisymmetric flow field. A technique is described for making a smooth change of cross-section shape from rectangular to circular. A feature is the considerable use of computer-graphics to provide a 'user-oriented' procedure which can produce promising design configurations for subsequent analysis with CFD codes. An example is given to demonstrate the capabilities of the design techniques.

IMPULSE WIND TUNNELS [IMPUL'SNYE AERODINAMICHESKIE TRUBY]

VLADLEN VLADIMIROVIC ZATOLOKA Novosibirsk, Izdatel'stvo Nauka, 1986, 144 p. In Russian. refs

The efficiency of using impulse wind tunnels for high-Reynolds-number flows is examined with reference to experimental data. It is shown that the compact size of the forechamber and the low quasi-stationarity of this type of wind tunnels makes it possible to produce, over the full Mach range (from transonic to high hypersonic), flow conditions that are practically unattainable in other wind tunnels. In addition, the impulse wind tunnels are much more compact and relatively inexpensive.

NEWTONIAN THEORY FOR THE COMPRESSION SURFACE OF AIRFOILS AT MODERATE OR LARGE INCIDENCE

HAMDI T. HEMDAN (King Saud University, Riyadh, Saudi Arabia) AIAA Journal (ISSN 0001-1452), vol. 25, Oct. 1987, p. 1281-1285. Research supported by King Saud University. refs

This paper considers the problem of steady Newtonian flow over the compression surface of sharp-edged, two-dimensional thin airfoils at moderate or large angles of attack. By combining the Newtonian limits gamma goes to 1 and freestream Mach number goes to infinity (where gamma is the ratio of the specific heats of the gas) with a geometric limiting process in which the wing thickness approaches zero, a system of approximate equations giving a first-order correction to the Newtonian flow is found. The equations are solved in closed form, and a simple formula for the coefficient of surface pressure is obtained. The formula shows the effects of nonzero (gamma - 1) and finite values of the freestream Mach number as well as the surface curvature and angle of attack. Results are presented for several airfoils at various flow parameters.

STRUCTURE OF SUPERSONIC TURBULENT FLOW PAST A SHARP FIN

DOYLE D. KNIGHT (Rutgers University, New Brunswick, NJ), C. C. HORSTMAN (NASA, Ames Research Center, Moffett Field, CA), SEYMOUR BOGDONOFF (Princeton University, NJ), and BRIAN SHAPEY AIAA Journal (ISSN 0001-1452), vol. 25, Oct. 1987, p. 1331-1337. NASA-supported research. refs
(Contract AF-AFOSR-82-0040)

The three-dimensional shock-wave/turbulent-boundary-layer interaction generated by a sharp fin is examined both experimentally and theoretically at Mach 3 for a fin angle 20 deg and Reynolds number 900,000. This study represents an extension of previous research for the sharp fin configuration to stronger interactions. The experimental data include surface pressure profiles, surface streamline patterns, and boundary-layer profiles of pitot pressure and yaw angle. Two separate theoretical approaches or 'models' were employed. Both models utilize the three-dimensional compressible Navier-Stokes equations in mass-averaged variables. The theoretical approach of Knight (1984 and 1985) employs the algebraic turbulent eddy-viscosity model of Baldwin and Lomax (1978), and the theoretical model of Horstman (1984) employs the two-equation turbulence model of Jones and Launder (1972) coupled with the wall function model of Viegas et al. (1985).

EXPERIMENTAL INVESTIGATION ON LONGITUDINAL CHARACTERISTICS OF THE FORWARD SWEEP WING

YAOBIN GUO, XUEJIAN WANG, and BINJIANG ZHANG (Harbin Aerodynamics Research Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 8, June 1987, p. B227-B238. In Chinese, with abstract in English.

The aerodynamic characteristics of forward-swept wings (FSWs) and swept-back wings (SBWs) at subsonic and transonic speeds are investigated experimentally in wind-tunnel tests. The results are presented in extensive tables and graphs and briefly characterized. At lower speeds, the performance of the FSW is shown to be significantly improved by modifying the separation flowfield over the inboard portion of the wing (e.g., by swept-back inboard fairings), and a closed coupled canard configuration with FSW is found to have much better lift/drag properties than the same configuration with an SWB. At Mach 1.1 and angle of attack 6 deg, the lift-induced drag of the FSW is 12.5 percent less than that of the SBW.

COMPUTATION OF THE COMPENSATION PITOT TUBE IN FRONT OF THE NOSE INLET OF AN AIRCRAFT AT TRANSONIC SPEED

YUN BAO and SHIJUN LUO (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 8, June 1987, p. B287-B290. In Chinese, with abstract in English. refs

The aerodynamically compensating pitot tube, which is used to reduce the error of an aircraft pressure altimeter, is studied by the mixed difference computation of small transonic disturbances. The static pressure distribution of the compensating pitot tube and the positive pressure field in front of the nose inlet are calculated. The static pressure error produced by the nose inlet is compensated by the negative pressure at the static pressure orifice of the pitot tube. The computed results and prediction agree very well with wind-tunnel and flight test data.

NUMERICAL SIMULATION OF TWO-DIMENSIONAL TRANSONIC FLOW OVER THIN OSCILLATING AIRFOIL

KAREL KOZEL and MIROSLAVA VAVRINCOVA Zprava VZLU, no. Z-51, 1986, p. 1-10. refs

Calculations of the two-dimensional transonic flow over an oscillating, thin airfoil in a channel using the finite-difference method and the original semiimplicit difference scheme are presented. The results demonstrate the suitability of both methods. The finite difference method yields results identical to the semiimplicit difference scheme for low values of the coefficient of reduced frequency as well as for higher and very high ones. The case of an unsteady flow over an oscillating airfoil for a simultaneous time variation of the velocity of the uniform parallel inlet flow is also considered. The finite difference method is suitable for use on available computers.

NUMERICAL SOLUTION OF FLOW OF IDEAL FLUID THROUGH CASCADE IN A PLANE

JAROSLAV PELANT Zprava VZLU, no. Z-52, 1987, p. 1-12.

The main purpose of the paper is to describe the numerical method for a flow of an ideal fluid through a cascade in a plane using Euler's equations rewritten into the integral form. The validity of the matter, energy, and momentum conservation laws is assumed. The integral form admits of discontinuities in velocity, pressure, and density. The method can do without prior definition of the subsonic and supersonic regions and it is based on the disintegration of the discontinuities in state values in the net of the region concerned.

NUMERICAL SOLUTION OF NON-STATIONARY THREE-DIMENSIONAL TRANSONIC FLOW OVER A THIN BODY

KAREL KOZEL and MIROSLAVA VAVRINCOVA Zpravodaj VZLU (ISSN 0044-5355), no. 4, 1987, p. 179-183. In Czech. refs

The paper deals with a numerical solution of an unsteady three-dimensional transonic flow over a thin body in a wind tunnel of rectangular cross section. The problem is described by an unsteady equation of a low disturbance potential. A weak solution considering occurrence of shock waves is defined by applying a conservative form of the basic equation. The problem is solved by applying the method of finite differences with the original semiimplicit difference scheme.

NUMERICAL STUDIES ON RAREFIED FLOW OVER A FLAT PLATE AT AN ANGLE OF ATTACK

E. M. SHAKHOV (AN SSSR, Vychislitel'nyi Tsentr, Moscow, USSR) IN: International Symposium on Rarefied Gas Dynamics, 15th, Grado, Italy, June 16-20, 1986, Proceedings. Volume 1. Stuttgart, B. G. Teubner, 1986, p. 482-491. refs

The numerical results on supersonic flow over a plate are based on a kinetic model. A finite difference method is employed. For the plate at zero incidence, the flow-over can be treated as hypersonic one as Mach number M is greater than about 5. The flow fields and the behavior of the aerodynamical characteristics are discussed for $M = 5-10$ and the Knudsen numbers from the range of Kn between 0.4 and infinity. The results are compared with the available experimental and computational data. As a conclusion, the effect of finite thickness and the influence of possible weak divergence of the stream on the aerodynamical coefficients are discussed. Author

SLIP EFFECTS ON SUPERSONIC FLOWFIELDS AROUND NACA 0012 AIRFOILS

J. ALLEGRE, M. RAFFIN (CNRS, Laboratoire d'Aerothermique, Meudon, France), and L. GOTTESDIENER (Paris VI, Université; CNRS, Laboratoire d'Aerothermique, Meudon, France) IN: International Symposium on Rarefied Gas Dynamics, 15th, Grado, Italy, June 16-20, 1986, Proceedings. Volume 1. Stuttgart, B. G. Teubner, 1986, p. 548-557. DRET-supported research. refs

The present investigation concerns flowfields around NACA 0012 airfoils located at zero angle of attack in a supersonic air stream characterized by a Mach number of 2 and a Reynolds number of 106 as based on the airfoil chord. Experimental density and velocity flowfields are compared with theoretical distributions calculated by solving Navier Stokes equations. Significant differences are shown between experimental and predicted values when no slip conditions are taken into account in the theory. Differences are considerably reduced when slip velocity and wall temperature jump are introduced in the theory. Author

AN IMPROVED STAGNATION POINT VISCOUS SHOCK LAYER FLOW OVER A BLUNT BODY

A. C. JAIN (Indian Institute of Technology, Kanpur, India) and PRADEEP KUMAR (Indian Space Research Organization, Vikram Sarabhai Space Centre, Trivandrum, India) IN: International Symposium on Rarefied Gas Dynamics, 15th, Grado, Italy, June 16-20, 1986, Proceedings. Volume 1. Stuttgart, B. G. Teubner, 1986, p. 597-606. refs

A new solution for the stagnation point viscous shock layer is presented which incorporates the effect of the stagnation point shock curvature. Governing equations for the leading terms are derived from the full Navier-Stokes equations and solved using surface slip and shock slip conditions consistent with the Navier-Stokes equations. Numerical solutions for a wide range of prescribed conditions are compared with available theoretical investigations and experimental data. It is noted that the new stagnation point viscous shock layer description has a greatly improved prediction capability in the low Reynolds number regime. V.L.

A CONTINUUM ANALYSIS OF CHEMICAL NONEQUILIBRIUM UNDER HYPERSONIC LOW-DENSITY FLIGHT CONDITIONS

R. N. GUPTA (NASA, Langley Research Center, Hampton, VA) IN: International Symposium on Rarefied Gas Dynamics, 15th, Grado, Italy, June 16-20, 1986, Proceedings. Volume 2. Stuttgart, B. G. Teubner, 1986, p. 432-441. refs

Results of employing the continuum model of Navier-Stokes equations under the low-density flight conditions are presented. These results are obtained with chemical nonequilibrium and multicomponent surface slip boundary conditions. The conditions analyzed are those encountered by the nose region of the Space Shuttle Orbiter during reentry. A detailed comparison of the Navier-Stokes (NS) results is made with the viscous shock-layer (VSL) and direct simulation Monte Carlo (DSMC) predictions. With the inclusion of new surface-slip boundary conditions in NS calculations, the surface heat transfer and other flowfield quantities adjacent to the surface are predicted favorably with the DSMC calculations from 75 km to 115 km in altitude. This suggests a much wider practical range for the applicability of Navier-Stokes solutions than previously thought. This is appealing because the continuum (NS and VSL) methods are commonly used to solve the fluid flow problems and are less demanding in terms of computer resource requirements than the noncontinuum (DSMC) methods. A HEAT TRANSFER MODEL FOR A HEATED HELIUM AIRSHIP M.S. Thesis

RAY M. RAPERT Mar. 1987 85 p
(AD-A183786) Avail: NTIS HC A05/MF A01 CSCL 01A

Basic heat transfer empirical and analytical equations are applied to a double envelope airship concept which uses heated helium in the inner envelope to augment and/or control gross lift. The convective and conductive terms lead to a linear system of five equations for the concept airship, with the nonlinear radiation terms included by an iterative solution process. A FORTRAN program, is used to perform the tedious calculations, and graphed results are obtained for the variables of interest. These indicate that the simple use of airship engine exhaust heat will give more than a 30 percent increase in gross airship lift. Possibly more than 100 percent increase can be achieved if a steam injection heating system, with associated design problems, is used. GRA

(ESA-TT-1072; DFVLR-FB-86-59; ETN-87-91131) Avail: NTIS HC A03/MF A01; original German version available from DFVLR, Cologne, Fed. Republic of Germany DM 16

Pressure distribution and wake measurements were carried out in a 1m x 1m transonic wind tunnel on a two-dimensional supercritical airfoil equipped with a perforated strip and a cavity underneath. Compared with reference measurements on the same model with a solid surface, the results of the model with the perforation/cavity arrangement at supercritical flow conditions show a substantial increase of the maximum lift and especially strong drag reductions. These aerodynamic improvements are related to the very favorable effect of the passive secondary flow through the perforation and cavity, induced by strong adverse pressure gradients in this region. The detrimental effects of the passive device on the aerodynamic characteristics of the airfoil at subcritical flow are negligible. ESA

A CRITICAL ASSESSMENT OF WIND TUNNEL RESULTS FOR THE NACA 0012 AIRFOIL

W. J. MCCROSKEY Oct. 1987 24 p Presented at the AGARD Fluid Dynamics Panel Symposium on Aerodynamic Data Accuracy and Quality: Requirements and Capabilities in Wind Tunnel Testing, Naples, Italy, 28 Sep. - 2 Oct. 1987

(NASA-TM-100019; A-87321; NAS 1.15:100019; USAAVSCOM-TM-87-A-5) Avail: NTIS HC A03/MF A01 CSCL 01A

A large body of experimental results, obtained in more than 40 wind tunnels on a single, well-known two-dimensional configuration, has been critically examined and correlated. An assessment of some of the possible sources of error has been made for each facility, and data which are suspect have been identified. It was found that no single experiment provided a complete set of reliable data, although one investigation stands out as superior in many respects. However, from the aggregate of data the representative properties of the NACA 0012 airfoil can be identified with reasonable confidence over wide ranges of Mach number, Reynolds number, and angles of attack. This synthesized information can now be used to assess and validate existing and future wind tunnel results and to evaluate advanced Computational Fluid Dynamics codes. Author

Five full scale rotorcraft airfoils were tested in the NASA Ames Eleven-Foot Transonic Wind Tunnel for full scale Reynolds numbers at Mach numbers from 0.3 to 1.07. The models, which spanned the tunnel from floor to ceiling, included two modern baseline airfoils, the SC1095 and SC1094 RB, which have been previously tested in other facilities. Three advanced transonic airfoils, designated the SSC-A09, SSC-A07, and SSC-B08, were tested to confirm predicted performance and provide confirmation of advanced airfoil design methods. The test showed that the eleven-foot tunnel is suited to two-dimensional airfoil testing. Maximum lift coefficients, drag coefficients, pitching moments, and pressure coefficient distributions are presented. The airfoil analysis codes agreed well with the data, with the Grumman GRUMFOIL code giving the best overall performance correlation. M.G.

PLANFORM EFFECTS ON THE SUPERSONIC AERODYNAMICS OF MULTIBODY CONFIGURATIONS

NAOMI MCMILLIN and RICHARD M. WOOD 1987 138 p (NASA-TP-2762; L-16312; NAS 1.60:2762) Avail: NTIS HC A07/MF A01 CSCL 01A

An experimental and theoretical investigation of the effect of planform on the supersonic aerodynamics of low-fineness-ratio multibody configurations was conducted. Longitudinal and lateral-directional aerodynamic and flow visualization data were obtained on three multibody configurations. The data indicated that planform has a small effect on the zero lift drag of a multibody configuration. The longitudinal data obtained at lifting conditions showed a sensitivity to planform shape. Lateral-directional data obtained for all configurations did not uncover any unusual stability traits for this class of configuration. A comparison study was also made between the planform effects observed on single-body and multibody configurations. Results from this study indicate that the multibody concept appears to offer a mechanism for employing a low-sweep wing with no significant increase in zero-lift drag but still retaining high-performance characteristics at high-lift conditions. Evaluation of the linear-theory prediction methods revealed a

EFFECTS OF JET EXHAUST YAW VANE INSTALLATION AND OPERATION ON THE LONGITUDINAL AND LATERAL-DIRECTIONAL CHARACTERISTICS OF THE F-14 AIRPLANE
DAVID E. REUBUSH and BOBBY L. BERRIER Dec. 1987 121 p
(NASA-TP-2769; L-16302; NAS 1.60:2769) Avail: NTIS HC A06/MF A01 CSCL 01A

A wind tunnel investigation was conducted in the Langley 16-Foot Transonic Tunnel to determine the effects of the installation and use of jet exhaust yaw vanes on the longitudinal and lateral-directional characteristics of the F-14 aircraft. The model was tested at Mach numbers from 0.70 to 1.25 at angles of attack from 0 deg to 4.3 deg. Compressed air was used to simulate nozzle exhaust flow from jet off up to a nozzle pressure ratio of 8. The results of the investigation show that the yaw vanes can augment the rudders to provide directional control, but further investigation will be necessary to optimize the deflection schedule associated with the various nozzle power settings. SEMIEMPIRICAL METHOD FOR PREDICTION OF AERODYNAMIC FORCES AND MOMENTS ON A STEADILY SPINNING LIGHT AIRPLANE
BANDU N. PAMADI (Vigyan Research Associates, Inc., Hampton, Va.) and LAWRENCE W. TAYLOR, JR. Dec. 1987 89 p
(NASA-TM-4009; L-15654; NAS 1.15:4009) Avail: NTIS HC A05/MF A01 CSCL 01A

A semi-empirical method is presented for the estimation of aerodynamic forces and moments acting on a steadily spinning (rotating) light airplane. The airplane is divided into wing, body, and tail surfaces. The effect of power is ignored. The strip theory is employed for each component of the spinning airplane to determine its contribution to the total aerodynamic coefficients. Then, increments to some of the coefficients which account for centrifugal effect are estimated. The results are compared to spin tunnel rotary balance test data. Author

THE DESIGN AND PRELIMINARY CALIBRATION OF A BOUNDARY-LAYER FLOW CHANNEL
DHANVADA M. RAO and TIMMY T. KARIYA (George Washington Univ., Washington, D.C.) Oct. 1987 37 p
(Contract NAS1-17919; NCC1-24)
(NASA-CR-178399; NAS 1.26:178399) Avail: NTIS HC A03/MF A01 CSCL 01A

Design procedures for a new low-speed boundary-layer research channel are described. The channel is an open-circuit wind tunnel for the study of two-dimensional boundary layers under controlled pressure gradients, and follows design guidelines from published literature on blower tunnels with wide-angle diffusers. The contraction was arranged in a modular fashion permitting two different test sections of square and high-aspect-ratio cross section. A radical type of wide-angle diffuser was employed, and a stream-tube computer code (GE Streamtube Curvature Code) was used to check the contraction designs. The alternate test sections have the following specifications: 2- by 2-foot cross section with a fixed velocity of 23 ft/sec, and a boundary-layer section with a 0.5- by 2-foot cross section at a fixed velocity of approximately 89 ft/sec. Experimental techniques and data are described for the evaluation of diffuser effectiveness, boundary-layer channel characteristics, and overall performance of the facility. Author

AN EXPERIMENTAL INVESTIGATION OF DYNAMIC GROUND EFFECT Final Report
PAI HUNG LEE, C. EDWARD LAN, and VINCENT U. MUIRHEAD
Washington Dec. 1987 85 p
(Contract NAG1-616)
(NASA-CR-4105; NAS 1.26:4105; CRING-FRL-717-1) Avail: NTIS HC A05/MF A01 CSCL 01A

A 60-degree delta wing, an F-106B, and an XB-70 model with and without flap deflections were tested in static and dynamic ground effect in the 36-by 51-inch subsonic wind tunnel at the University of Kansas. Dynamic ground effect was measured with movable sting support. For flow visualization, a tufted wire grid was mounted on the movable sting behind the model. Test results showed that lift and drag increments in dynamic ground effect were always lower than static values. Effect of the trailing edge flap deflections on lift increments was slight. The fuselage reduced the lift increments at a given ground height. From flow visualization under static conditions, the vortex core was seen to enlarge as the ground was approached. Author

AERODYNAMIC SENSITIVITIES FROM SUBSONIC, SONIC AND SUPERSONIC UNSTEADY, NONPLANAR LIFTING-SURFACE THEORY
E. CARSON YATES, JR. Sep. 1987 18 p
(NASA-TM-100502; NAS 1.15:100502) Avail: NTIS HC A03/MF A01 CSCL 01A

The technique of implicit differentiation has been used in combination with linearized lifting-surface theory to derive analytical expressions for aerodynamic sensitivities (i.e., rates of change of lifting pressures with respect to general changes in aircraft geometry, including planform variations) for steady or oscillating planar or nonplanar lifting surfaces in subsonic, sonic, or supersonic flow. The geometric perturbation is defined in terms of a single variable, and the user need only provide simple expressions or similar means for defining the continuous or discontinuous global or local perturbation of interest. Example expressions are given for perturbations of the sweep, taper, and aspect ratio of a wing with trapezoidal semispan planform. In addition to direct computational use, the analytical method presented here should provide benchmark criteria for assessing the accuracy of aerodynamic sensitivities obtained by approximate methods such as finite geometry perturbation and differencing. The present process appears to be readily adaptable to more general surface-panel methods. Author

A METHOD FOR THE EFFICIENT CALCULATION OF ELASTIC ROTOR BLADE DYNAMIC RESPONSE IN FORWARD FLIGHT Ph.D. Thesis
DANA JAMES TAYLOR 1987 188 p
Avail: Univ. Microfilms Order No. DA8715823

A comprehensive set of nonlinear, integro-partial differential equations of motion are developed for an elastic rotor blade with nonuniform structural, geometric and aerodynamic properties, and chordwise offsets with flap, lag, and torsional degrees of freedom. The structural dynamic formulation parallels that derived by Hodges and Dowell and is extended for forward flight. The aerodynamic formulation parallels the development presented by Kaza and Kvaternik and is extended to consider linear inflow and unsteady aerodynamic approximations. The governing equations are solved in an efficient manner utilizing a modified Galerkin-generalized harmonic balance approach. Incorporated into the solution method is the capability of considering the elastic deformation of the rotor blade while calculating the control inputs. Results are presented which represent the response, shown in terms of nondimensional tip displacement as well as root loads, of an isolated articulated rotor whose blades possess nonuniform properties and chordwise offsets. The flight conditions considered are hover and forward flight at $\mu = 0.2$ and $m = 0.4$. The quantitative effects of

unsteady aerodynamics, linear inflow, and elastic trim are shown. It is concluded that the consideration of unsteady aerodynamics, nonuniform inflow and blade elasticity when calculating trim is dependent on the final use of the response. Dissert. Abstr.

APPLICATION OF RUNGE KUTTA TIME MARCHING SCHEME FOR THE COMPUTATION OF TRANSONIC FLOWS IN TURBOMACHINES

S. V. SUBRAMANIAN and R. BOZZOLA (Avco Lycoming Div., Stratford, Conn.) 1987 19 p Presented at the 21st Joint Propulsion Conference, Monterey, Calif., 8-10 Jul. 1985; sponsored by AIAA, SAE and ASME Previously announced in IAA as A85-39728

(NASA-TM-86997; E-2543; NAS 1.15:86997) Avail: NTIS HC A03/MF A01 CSCL 01A

Numerical solutions of the unsteady Euler equations are obtained using the classical fourth order Runge Kutta time marching scheme. This method is fully explicit and is applied to the governing equations in the finite volume, conservation law form. In order to determine the efficiency of this scheme for solving turbomachinery flows, steady blade-to-blade solutions are obtained for compressor and turbine cascades under subsonic and transonic flow conditions. Computed results are compared with other numerical methods and wind tunnel measurements. The study also focuses on other important numerical aspects influencing the performance of the algorithm and the solution accuracy such as grid types, boundary conditions and artificial viscosity. For this purpose, H, O, and C type computational grids as well as characteristic and extrapolation type boundary conditions are included in solution procedures.

A 0.15-SCALE STUDY OF CONFIGURATION EFFECTS ON THE AERODYNAMIC INTERACTION BETWEEN MAIN ROTOR AND FUSELAGE

TED TREPT Jan. 1984 634 p

(Contract NAS2-11268)

(NASA-CR-166577; NAS 1.26:166577) Avail: NTIS HC A99/MF A01 CSCL 01A

Hover and forward flight tests were conducted to investigate the mutual aerodynamic interaction between the main motor and fuselage of a conventional helicopter configuration. A 0.15-scale Model 222 two-bladed teetering rotor was combined with a 0.15-scale model of the NASA Ames 40x80-foot wind tunnel 1500 horsepower test stand fairing. Configuration effects were studied by modifying the fairing to simulate a typical helicopter forebody. Separation distance between rotor and body were also investigated. Rotor and fuselage force and moment as well as pressure data are presented in graphical and tabular format. Data was taken over a range of thrust coefficients from 0.002 to 0.007. In forward flight speed ratio was varied from 0.1 to 0.3 with shaft angle varying from +4 to -12 deg. The data show that the rotors effect on the fuselage may be considerably more important to total aircraft performance than the effect of the fuselage on the rotor. Author

THE AERODYNAMICS OF SUPERSONIC PARACHUTES

C. W. PETERSON Jun. 1987 29 p Presented at the Parachute Systems Technology: Fundamentals, Concepts, and Applications, Munich, Fed. Republic of Germany, 22 Jun. 1987

(Contract DE-AC04-76DP-00789)

(DE87-014846; SAND-87-1395C; CONF-8706165-3) Avail: NTIS HC A03/MF A01

A discussion of the aerodynamics and performance of parachutes flying at supersonic speeds is the focus of this paper. Typical performance requirements for supersonic parachute systems are presented, followed by a review of the literature on supersonic parachute configurations and their drag characteristics. Data from a recent supersonic wind tunnel test series is summarized. The value and limitations of supersonic wind tunnel data on hemisflo and 20-degree conical ribbon parachutes behind

several forebody shapes and diameters are discussed. Test techniques were derived which avoided many of the opportunities to obtain erroneous supersonic parachute drag data in wind tunnels. Preliminary correlations of supersonic parachute drag with Mach number, forebody shape and diameter, canopy porosity, inflated canopy diameter and stability are presented. Supersonic parachute design considerations are discussed and applied to a $M = 2$ parachute system designed and tested at Sandia. It is shown that the performance of parachutes in supersonic flows is a strong function of parachute design parameters and their interactions with the payload wake. DOE

DEVELOPMENT AND APPLICATION OF COMPUTATIONAL AEROTHERMODYNAMICS FLOWFIELD COMPUTER CODES Technical Progress Report, 1 Sep. 1986 - 31 Oct. 1987

ETHIRAJ VENKATAPATHY 9 Dec. 1987 29 p

(Contract NCC2-420)

(NASA-CR-181534; NAS 1.26:181534) Avail: NTIS HC A03/MF A01 CSCL 01A

Multiple nozzle plume flow field is computed with a 3-D, Navier-Stokes solver. Numerical simulation is performed with a flux-split, two-factor, time asymptotic viscous flow solver of Ying and Steger. The two factor splitting provides a stable 3-D solution procedure under ideal-gas assumptions. An ad-hoc acceleration procedure that shows promise in improving the convergence rate by a factor of three for steady state problems is utilized. Computed solutions to generic problems at various altitude and flight conditions show flow field complexity and three-dimensional effects due to multiple nozzle jet interactions. Viscous, ideal gas solutions for the symmetric nozzle are compared with other numerical solutions. Author

THREE-DIMENSIONAL UNSTEADY FLOW ELICITED BY FINITE WINGS AND COMPLEX CONFIGURATIONS Ph.D. Thesis

JEFFREY CLAYTON ASHWORTH 1987 191 p

Avail: Univ. Microfilms Order No. DA8716236

The spatial and temporal transport, accumulation and dissipation of vorticity on the surface of 3 wings varying only in sweep angles were examined using flow visualization and hot wire anemometry. Identical geometric positions were tested on each wing for a variety of dynamic parameters. Each sweep geometry produced distinct, time dependent, spanwise and chordwise sites for vorticity accumulation into large scale leading edge and wingtip vortices. The wingtip and leading edge vortex interactions produced spanwise flow patterns uncharacteristic of 2 dimensional flows. Wing sweep is a dominant geometric parameter in analyzing the effects of unsteady wingtip flow. An initial investigation into the feasibility of unsteady flow application was performed on a model of the X-29 Forward Swept Wing Technology Demonstrator. This model geometry produces complex flow patterns but may be ideally suited for application of unsteady flow technology. These investigations provide initial insight into 3 dimensional flow behavior elicited by different sweep geometries and dynamic parameters.

SOLUTION OF THE TWO-DIMENSIONAL EULER EQUATIONS ON UNSTRUCTURED TRIANGULAR MESHES Ph.D. Thesis

DIMITRI JAMES MAVRIPLIS 1987 157 p

Avail: Univ. Microfilms Order No. DA8716898

Solutions of inviscid subsonic and transonic flows about multi-element airfoils are obtained using two-dimensional Euler equations. An edge-based data structure is adopted, where the simplest element of the mesh is taken as the edge rather than the triangular element itself. Two finite-volume discretization schemes are developed, one where the flow variables are stored at the center of each triangular element, and the other where the flow variables are stored at the vertices of the triangles. Convergence to a steady state is accelerated by local time-stepping, enthalpy-damping, and implicit residual-averaging. A novel multigrid algorithm for use on a sequence of completely

unstructured, unrelated meshes is also developed. Solutions of both Euler schemes are compared to a variety of numerical results and experimental data and are found to exhibit similar accuracy to other existing Euler solvers. However, it was found that viscous effects on multi-element airfoils are most often non-negligible, e.g., drag is underpredicted by 10 to 15 percent for a particular case involving small regions of viscous flow. The use of unstructured meshes was found to result in substantially higher memory and CPU time requirements due to the indirect addressing needed and the use of shorter vector lengths. On the other hand, they enable the solution of the flow about arbitrarily shaped two-dimensional bodies. Dissert. Abstr.

CALCULATION OF THREE-DIMENSIONAL STATIONARY TURBULENT BOUNDARY LAYER ON ROOT SECTION OF WING IGNORING COMPRESSIBILITY Abstract Only

G. A. SHCHEKIN *In its* USSR Report: Engineering and Equipment p 89 28 May 1987 Transl. into ENGLISH from Izvestiya Vysshikh Uchebnykh Zavedeniy: Aviatsonnaya Tekhnika (Kazan, USSR), no. 4, Oct. - Dec. 1985 p 72-76
 Avail: NTIS HC A06/MF A01

A method for calculating a three dimensional steady state turbulent boundary layer is proposed. It is based on a general method for calculating three dimensional compressible laminar and turbulent boundary layers on arbitrary wings. Boundary conditions on the surface and on the external boundary of the boundary layer were formulated. In the transition region, the coefficient of turbulent viscosity increases in direct proportion to the longitudinal coefficient of intermittency. After transformations, the initial set of equations was solved numerically using the Petukhov finite differences method. For solving the set of equations on a computer, a computer program, written in FORTRAN, was written. Components of the local coefficient of friction resistance, projected onto the chord and wing span directions, the displacement of thickness of the three dimensional boundary layer, and the boundary of the separation region were calculated. Expressions for calculating these parameters are presented. Author

CALCULATION OF AERODYNAMIC CHARACTERISTICS OF THREE-DIMENSIONAL FINITE SPAN WINGS IN POTENTIAL INCOMPRESSIBLE FLOW Abstract Only

S. D. YERMOLENKO and YE. A. RYAGUZOV *In its* USSR Report: Engineering and Equipment p 90 28 May 1987 Transl. into ENGLISH from Izvestiya Vysshikh Uchebnykh Zavedeniy: Aviatsonnaya Tekhnika (Kazan, USSR), no. 4, Oct. - Dec. 1985 p 43-48
 Avail: NTIS HC A06/MF A01

A simpler and less time consuming method for calculating the aerodynamic characteristics of three dimensional finite span wings in potential incompressible flow is given. It is based on the application of the discrete vortex method which earlier proved to be effective in solving two dimensional problems. A non-separating potential incompressible flow was examined under the assumption that the wing surface was specified, wherein the left hand side of the wing was symmetrical to its right hand side, its leading and trailing edges were straight, and its ends were flat and there was

no slippage. Wing profile could vary across the span and had a geometric twist. The method for constructing a vortex model was explained. Intensities of vortices were determined. Formulae for reduced flow velocity and static pressure coefficient in reference points were derived. Examples of pressure distribution in the root, end and mid-sections of thick wings, calculated in accordance with the proposed method and the authors' methods were presented. These results were compared to wind tunnel tests of the wings. Design and experimental data were in good agreement. Author

SOME ASYMPTOTIC MODES OF TRANSONIC VORTEX FLOW Abstract Only

A. G. KUZMIN *In its* USSR Report: Engineering and Equipment p 91 28 May 1987 Transl. into ENGLISH from Vestnik Leningradskogo Universiteta, Seriya 1: Matematika, Mekhanika, Astronomiya (Leningrad, USSR), no. 2, Apr. 1986 p 61-65 Original language document was announced in IAA as A87-15553
 Avail: NTIS HC A06/MF A01

Steady state plane parallel vortex flows of an ideal gas are investigated analytically. In particular, a study is made of the qualitative flow patterns in the vicinity of a point where the sonic line is orthogonal with respect to the velocity vector and in the vicinity of a point on the sonic line where acceleration is equal to zero. Together with the results of Shifrin (1966), the results obtained here provide information on all possible flow patterns near the point where the sonic line is orthogonal to the velocity vector and demonstrate a large variety of possible flow patterns near the zero acceleration point. NUMERICAL STUDY OF SUPERSONIC FLOW AROUND BLUNT BODIES WITH EXTENDED NEEDLE NOSE Abstract Only

V. N. KARLOVSKIY and V. I. SAKHAROV *In its* USSR Report: Engineering and Equipment p 93 28 May 1987 Transl. into ENGLISH from Izvestiya Akademii Nauk SSSR Mekhanika Zhidkosti i Gaza (Moscow, USSR), no. 3, May - Jun. 1986 p 119-127
 Avail: NTIS HC A06/MF A01

A method was developed for the calculation of supersonic flow of an ideal gas around axisymmetrical blunted bodies with extended needle noses. A study is made of the flow around a truncated cone with a spherical blunted cylindrical needle as a function of the ratio of needle length to diameter of the end portion of the body and Mach number of the incident stream. Several steady flow modes were obtained, including one with circulation zones in the shock layer and internal shock wave. The installation of a needle in advance of the truncated cone can reduce its resistance by 40 to 50 percent. A full study of the change in drag as a function of ratio of needle length is performed for Mach 3. Author

H. GERALD GROSS (Wickes Manufacturing Co., H. Koch and Sons Div., Anaheim, CA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings. Newhall, CA, SAFE Association, 1987, p. 80-87.

A88-13392**AIRCRAFT PASSENGER PROTECTION FROM SMOKE AND FIRE**

JOHN S. S. STEWART (Royal Albert Edward Infirmary, Wigan, England) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings. Newhall, CA, SAFE Association, 1987, p. 112-116. refs

The hazards that onboard smoke and fire present to passengers are reviewed, and methods of minimizing them are discussed. Trials of the Integrated Breathing Requirements Equipment for Air Transport Hazards and Evacuation (IBREATHE) system are described, and the results are reviewed. Hybrid safety systems are addressed, and the cost effectiveness of protection is briefly considered. C.D.

A88-13397**H-46 HELICOPTER EMERGENCY FLOTATION SYSTEM (HEFS)**

JOHN J. TYBURSKI and WILLIAM A. MAWHINNEY (U.S. Navy, Naval Air Development Center, Warminster, PA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings. Newhall, CA, SAFE Association, 1987, p. 147-152. refs

The Helicopter Emergency Flotation System (HEFS), developed to provide emergency flotation after a controllable water landing, is described. HEFS will keep a helicopter afloat in an upright attitude with escape hatches above the water level for 10 minutes to permit crew and passenger egress. It will keep the aircraft afloat for three hours to permit aircraft recovery. Design verification test results on the HEFS float and pod are reviewed, as are the results of full-system hulk tests and of inflight testing. Test conditions and corresponding results are listed. C.D.

A88-13403**DEALING WITH THE PROBLEM OF DELAYED EJECTIONS**

WILLIAM L. LITTLE (U.S. Navy, Naval Air Development Center, Warminster, PA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings. Newhall, CA, SAFE Association, 1987, p. 212-214.

The Navy's possible short-term solution to the problem of delayed ejections is discussed as well as some long-range plans. Based on a preliminary analysis, the Navy found that the areas of safe escape envelopes, reasons for delayed ejection, and the

decision making process offered the biggest potential for immediate improvement. Consideration has been given to the use of simulators, a ground proximity warning system, and a computer system that would prevent the aircraft from descending below a predetermined altitude. K.K.

A88-13408**AN UPDATE ON THE DUAL-STAGE TEST PROCEDURE FOR LOW-COST MEASUREMENT OF PARACHUTE PERFORMANCE**

RICHARD W. HUNTER (U.S. Naval Weapons Center, China Lake, CA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings. Newhall, CA, SAFE Association, 1987, p. 247-249.

The dual-stage test procedure was developed at the Naval Weapons Center (NWC) in 1984 as a low-cost alternative to drop testing from aircraft. The test procedure has undergone considerable evolutionary development during its use. The improvements reported here have greatly increased the versatility and usability of the test procedure, with little or no effect on test costs. The improvements include the development and verification of equipment for measuring riser loads, and improved onboard film and live video coverage of the tests. Author

A88-13410**L.W. SKAD (LIGHT WEIGHT SURVIVAL KIT AIR DROPPABLE) DEVELOPMENT PROGRAM**

PETER D. JOHNSON (Irvin Industries Canada, Ltd., Fort Erie) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings. Newhall, CA, SAFE Association, 1987, p. 260-263.

The L.W. SKAD system has been designed to provide accurate and reliable positioning of two liferafts, which are necessary for the survival of those in distress at sea. The functional L.W. SKAD system contains a tail cone and pilot chute assembly, a main chute assembly, a cutter cord assembly, a raft package 'A' assembly, a drogue and rope coil assembly, a raft package 'B' assembly, and a bulkhead and ejection bag assembly. The use of L.W. SKAD on the Tracker and on the de Havilland Dash 8 and the Canadair Challenger has been considered. K.K.

A88-14261#**MODIFICATION OF VTOL FLIGHT FOR REDUCTION OF HOT GAS INGESTION AND FOREIGN OBJECT DAMAGE**

ANDREW B. BAUER (Douglas Aircraft Co., Long Beach, CA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 8 p. refs (AIAA PAPER 87-2883)

VTOL lift engine exhausts interfere with takeoff and landing operations by blowing loose ground particles and other debris that can be ingested by the engines with deleterious effects. A large VTOL aircraft configuration is presently used in conjunction with jet experiment correlations to demonstrate the ways in which forward and aft motion can alleviate such particle ingestion problems, in exchange for a field length increase to 300 ft, assuming zero wind. While wind conditions aid these methods in takeoff, they exacerbate the problems encountered in landings. Recommendations for further research are formulated. O.C.

A88-14310**SOME OPERATIONAL ASPECTS RELATED TO PLANNING OF AIRSHIP OPERATIONS IN NEW ZEALAND**

MAURICE E. MCGREAL IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 13.1 to 13.14.

03 AIR TRANSPORTATION AND SAFETY

A88-14314

THE PASSENGER POTENTIAL OF AIRSHIPS

C. M. SMALL IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 17.1 to 17.8.

An overall evaluation is made of the applicability of airships to such passenger services as short-haul business traffic, charter tours, sightseeing, very long range/nonstop flights, and cable-car functions. The airship offers low capital and operating costs, quietness for both overflown populations and the passengers carried, exceptional safety, and resources for passenger comfort that other types of aircraft cannot provide. Above all, the airship's ability to VTOL and hover renders it capable of reaching remote, rugged terrain and small population centers lacking airstrips, such as may be found on otherwise attractive islands and mountainous regions. O.C.

B-1B AVIONICS SYSTEM SAFETY OVERVIEW AND APPROACH

H. L. ERNST and C. R. TURNER (Boeing Military Airplane Co., Seattle, WA) IN: Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 109-132. refs (SAE PAPER 860854)

This paper presents an overview of the B-1B avionics safety analysis. Nuclear safety and terrain-following flight safety were major concerns. Analyses demonstrate that all safety requirements were met. Extensive coordination with the B-1B System Program Office and the support of major B-1B avionics subcontractors was required. The paper summarizes the nuclear safety effort. It presents significant details of the terrain-following analyses to give insight into the technical and integration challenges. Lessons learned are included. Author

SAFETY AWARENESS CONTINUITY IN TRANSPORTATION AND SPACE SYSTEMS

JOHN C. MACIDULL (FAA, Washington, DC) IAF, International Astronautical Congress, 38th, Brighton, England, Oct. 10-17, 1987. 7 p. refs (IAF PAPER 87-568)

The problem of safety awareness in transportation and space systems is discussed with particular reference to the role of definitions, maintenance and safety throughout the system life, the tools of statistics and accident investigation, and some strategies that can be applied to both space vehicles and earth-bound systems. Both proactive and reactive methods of accident prevention are examined. The discussion is illustrated by naval and commercial aircraft historical data and results of the Space Shuttle Challenger investigation. V.L.

A88-16660

MARITIME MISSIONS USING AN INTEGRATED LTA ROLE

A. SARSONS (LR Vivian Associates, Ltd., Toronto, Canada) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 169-193.

The paper presents a concept for the Canadian defence application of LTA in the Atlantic theater. It outlines a plan to integrate LTA with existing equipment to provide a more comprehensive, cost-effective system for maritime surveillance. Once the concept has been implemented, and a viable system established, carbon copies would be developed for the Pacific theater and other NATO countries with similar needs. Author

A88-16661

AIR WORTHINESS CERTIFICATION IN CANADA

LEO GALVIN (Transport Canada, Ottawa) IN: Lighter Than Air International Conference, Vancouver, Canada, Sept. 18, 19, 1986, Proceedings. Edmonton, Canada, Lighter Than Air International, 1986, p. 211-215.

Domestic and foreign LTA aircraft certification procedures in Canada are discussed. It is stressed that any applicants for Canadian certification should make clear whether they anticipate a U.S. market for the airship in question, and will therefore seek FAA approval in due course. Attention is given to the character and significance of the certification compliance program that must be formulated for each applicant. The basis of certification for foreign country-certified aircraft must be acceptable to the Canadian Department of Transport. O.C.

A88-16735

PASSENGER CABIN SAFETY; PROCEEDINGS OF THE SYMPOSIUM, LONDON, ENGLAND, OCT. 29, 1986

London, Royal Aeronautical Society, 1987, 48 p. For individual items see A88-16736 to A88-16741.

The present conference on passenger cabin safety discusses comparative accident statistics characterizing the year 1985, CAA airworthiness requirements for airliner cabins, noteworthy accident investigation determinations, and safety-related policy formulations by a major British airline. Also discussed are airliner staff training for cabin emergencies, aspects of passenger cabin health and safety, the safety-related services rendered by airline professionals, passenger behavior in aircraft emergencies, and the status of current research efforts in the field of airliner passenger safety. O.C.

A88-16736

ACCIDENT STATISTICS

A. F. TAYLOR (Cranfield Aviation Safety Centre, England) IN: Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986. London, Royal Aeronautical Society, 1987, p. 1-8. refs

The year of 1985 (which was exceptionally severe for British commercial aviation, with particular reference to the B737 airliner accident at Manchester) is placed in the context of previous years and previous survivable accidents. The B737 accident, although apparently very severe, is judged to have been typical of a survivable, 'on-the-airport' fire accident with no fuselage damage and no fatalities due to impact trauma. The findings and recommendations of the Accidents Investigation Branch will accordingly be relevant not only to this accident but also to a large and important group of other accidents. O.C.

A88-16737

PASSENGER CABIN SAFETY - CAA AIRWORTHINESS REQUIREMENTS

D. V. WARREN (Civil Aviation Authority, Airworthiness Div., London, England) IN: Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986. London, Royal Aeronautical Society, 1987, p. 9-16.

By definition, cabin safety requirements are concerned with survivable or partially survivable accidents and must take into account both the frailty of the human body and the vagaries of human behavior. The two fields of primary activity addressed are fire suppression and survival (notably including rapid escape), and crash/impact survival (which is primarily concerned with cabin structures). Attention is presently given to the fire resistance of cabin seats and ceiling panels, type III emergency exits, and the formulation of future requirements for smoke hoods, passageways, and the distribution of exits. O.C.

A88-16738

AN AIRLINE PHILOSOPHY TO SAFETY

J. D. LEWRY (British Caledonian Airways, Ltd., Crawley, England)
IN: Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986. London, Royal Aeronautical Society, 1987, p. 17-24.

Passenger cabin safety considerations ensure that cabin emergencies are not caused by poor design or the misuse of cabin facilities, and that passengers and crews have good prospects of survival in case of accidents or incidents. It is also necessary to ensure that equipment and work practices adhere to (the UK's) Health and Safety at Work legislation. Attention is presently given to passenger awareness of safety factors, problems caused by on-cabin baggage, and general human factors considerations. O.C.

A88-16740

PASSENGERS AND PROFESSIONALS - THE SAFETY PARTNERSHIP

N. BLYTHE (Consumers' Association, England) IN: Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986. London, Royal Aeronautical Society, 1987, p. 46-51.

An evaluation is made of the advantages derivable by airliner safety professionals from the fact of intense passenger concern for cabin safety. A recent survey of passengers' attitudes noted a willingness to experiment with crash impact-absorbing, backward-facing airliner seating. Similar initiatives are suggested to be capable of finding enthusiastic support in such matters as harness-type seat belts, safer cabin disposition of duty-free goods, and the already-topical issue of smoke hoods' adoption as emergency breathing equipment. O.C.

CIVIL APPLICATIONS OF HIGH-SPEED ROTORCRAFT AND POWERED-LIFT AIRCRAFT CONFIGURATIONS

JAMES A. ALBERS and JOHN ZUK Oct. 1987 28 p Prepared for presentation at the International Powered Lift Conference, Santa Clara, Calif., 7-10 Dec. 1987

(NASA-TM-100035; A-87339; NAS 1.15:100035) Avail: NTIS HC A03/MF A01 CSCL 01C

Advanced subsonic vertical and short takeoff and landing (V/STOL) aircraft configurations offer new transportation options for civil applications. Described is a range of vehicles from low-disk to high-disk loading aircraft, including high-speed rotorcraft, V/STOL aircraft, and short takeoff and landing (STOL) aircraft. The status and advantages of the various configurations are described. Some of these show promise for relieving congestion in high population-density regions and providing transportation opportunities for low population-density regions. Author

EXPERIMENTAL EVIDENCE FOR MODIFYING THE CURRENT PHYSICAL MODEL FOR ICE ACCRETION ON AIRCRAFT SURFACES

W. OLSEN and E. WALKER 1986 47 p Film supplement (NASA-TM-87184; E-3658; NASA-MPD-1683; NAS 1.15:87184)

Avail: NTIS HC A03/MF A01; film supplement number NASA-MPD-1683 available from NASA Lewis Research Center, Photographic and Printing Branch, Cleveland, Ohio CSCL 01C

Closeup movies, still photographs, and other experimental data suggest that the current physical model for ice accretion needs significant modification. At aircraft airspeeds there was no flow of liquid over the surface of the ice after a short initial flow, even at barely subfreezing temperatures. Instead, there were very large stationary drops on the ice surface that lose water from their bottoms by freezing and replenish their liquid by catching the microscopic cloud droplets. This observation disagrees with the existing physical model, which assumes there is a thin liquid film continuously flowing over the ice surface. With no such flow, the freezing-fraction concept of the model fails when a mass balance is performed on the surface water. Rime ice does, as the model predicts, form when the air temperature is low enough to cause the cloud droplets to freeze almost immediately on impact. However, the characteristic shapes of horn-glaze ice or rime ice are primarily caused by the ice shape affecting the airflow locally and consequently the droplet catch and the resulting ice shape. Ice roughness greatly increases the heat transfer coefficient, stops the movement of drops along the surface, and may also affect the airflow initially and thereby the droplet catch. At high subfreezing temperatures the initial flow and shedding of surface drops have a large effect on the ice shape. At the incipient freezing limit, no ice forms.

AIRCRAFT FIRE SAFETY RESEARCH

BENITO P. BOTTERI In NASA. Lewis Research Center, Spacecraft Fire Safety p 65-72 1987

Avail: NTIS HC A07/MF A01 CSCL 01C

During the past 15 years, very significant progress has been made toward enhancing aircraft fire safety in both normal and hostile (combat) operational environments. Most of the major aspects of the aircraft fire safety problem are touched upon here. The technology of aircraft fire protection, although not directly applicable in all cases to spacecraft fire scenarios, nevertheless does provide a solid foundation to build upon. This is particularly true of the extensive research and testing pertaining to aircraft interior fire safety and to onboard inert gas generation systems, both of which are still active areas of investigation. OVERLOOKED POTENTIAL OF SYSTEMS WITH MARKOVIAN COEFFICIENTS

HENK A. P. BLOM (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 1758-1764. refs

The usual system of linear stochastic difference equations with Markovian coefficients is generalized to cover R-exp-n-valued processes which jump simultaneously with and due to jumps of the coefficients. The additional modeling potential is illustrated for a maneuvering aircraft. In addition, candidate algorithms are reviewed for the filtering of partial observations of the generalized system; these include the generalized pseudo Bayes algorithm and the interacting multiple model algorithm. APPLICATIONS OF DAMAGE TOLERANCE ANALYSIS TO IN-SERVICE AIRCRAFT STRUCTURES

D. R. SHOWERS, R. L. JANSEN, T. F. CHRISTIAN, JR., and J. A. WAGNER (USAF, Warner Robbins Air Logistics Center, Robbins AFB, GA) IN: Analyzing failures: The problems and the solutions. Metals Park, OH, ASM International, 1986, p. 159-166. refs

An improved method of aircraft structural analysis is presented which is based upon finite element analysis and fracture mechanics techniques. Analytical aspects of durability and damage tolerance analysis are discussed with respect to U.S. Air Force transport and fighter aircraft. A flight-by-flight crack growth methodology is developed, and the advantages of the present method over previous force management techniques are discussed. Application of the method to operational aircraft structural analyses demonstrate the ability of the method to provide rapid input to aircraft structural considerations such as fatigue safety limits and maintenance inspection intervals. HIGH DYNAMIC GPS RECEIVER USING MAXIMUM LIKELIHOOD ESTIMATION AND FREQUENCY TRACKING

W. J. HURD, J. I. STATMAN, and V. A. VILNOTTER (California Institute of Technology, Jet Propulsion Laboratory, Pasadena) IEEE Transactions on Aerospace and Electronic Systems (ISSN 0018-9251), vol. AES-23, July 1987, p. 425-437. refs (Contract AF TASK RE-182)

A new high dynamic global positioning system (GPS) receiver is presented and its performance characterized by analysis, simulation, and demonstration. The demonstration receiver is a breadboard model capable of tracking a single simulated satellite signal in pseudorange and range rate. Pseudorange and range rate estimates are made once every 20 ms, using a maximum likelihood estimator, and are tracked by means of a third-order fading memory filter in a feedback configuration. The receiver tracks pseudorange with rms errors of under 1 m when subjected to simulated 50 g, 40 g/s circular trajectories. The tracking threshold is approximately 28 dB-Hz, which provides 12 dB margin relative to the minimum specified signal strength, assuming 3.5 dB system noise figure and 0 dBi antenna gain. Author

AVSAT - AN AERONAUTICAL SATELLITE COMMUNICATIONS SYSTEM

WALTER J. GRIBBIN (Aeronautical Radio, Inc., Annapolis, MD) IAF, International Astronautical Congress, 38th, Brighton, England, Oct. 10-17, 1987. 6 p. (IAF PAPER 87-477)

The projected 'AvSat' system is an industry-owned and -managed global aeronautical satellite system consisting of a ground segment, avionics, and cabin systems, as well as a space segment. AvSat uses a fully integrated digital transmission system for voice and data, based on multichannel, fully interactive TDMA that furnishes total interconnectivity between various aircraft and four earth stations. When fully developed, AvSat will incorporate shared and dedicated satellites in GEO to provide redundant, near-global coverage. O.C.

PLANNING OF ADVANCED MARITIME AND AERONAUTICAL MOBILE SATELLITE SYSTEM WITH MULTIBEAM FREQUENCY RE-USE

NIZAR SULTAN (Canadian Astronautics, Ltd., Ottawa, Canada) IAF, International Astronautical Congress, 38th, Brighton, England, Oct. 10-17, 1987. 7 p. refs (IAF PAPER 87-480)

The paper is concerned with the optimization of the principal parameters of an advanced mobile satellite system serving a variety of users that are not uniformly distributed, with a limited L-band frequency spectrum requiring frequency reuse among spot beams. The approach used here consists of analyzing the optimum multibeam antenna for maximum frequency reuse capabilities, devising a channelization and routing scheme, modeling the transponder by software and optimizing the payload mass and power for existing buses and launchers. It is shown that an optimized 3.4-meter reflector antenna can handle over fifty thousand vessels and aeroplanes with a 5-MHz L-band frequency reuse configuration using an adaptive subband channelization and reconfigurability system developed here. V.L.

THE INFLUENCE OF HELICOPTER FLIGHT PARAMETERS ON THE RESULTS OF MEASUREMENTS OF HORIZONTAL RADIATION PATTERNS OF VHF/UHF BROADCASTING ANTENNAE

DANIEL J. BEM, JAROSLAW JANISZEWSKI, and RYSZARD ZIELINSKI (Wroclaw, Politechnika, Poland) IN: Electromagnetic compatibility 1986; Proceedings of the Eighth International Wroclaw Symposium, Wroclaw, Poland, June 24-26, 1986. Part 2. Wroclaw, Poland, Wroclaw Technical University Press, 1986, p. 401-411.

The selection of optimum flight parameters as well as navigation influence on the measurement results are discussed. The corrections which permit a decrease in measurement errors related to inaccurate helicopter navigation are determined. An unconventional method of data processing was elaborated to increase the accuracy of determining the antenna pattern. The efficiency of the methods presented is illustrated with an example. Author

GPS VERTICAL AXIS PERFORMANCE ENHANCEMENT FOR HELICOPTER PRECISION LANDING APPROACH

ROBERT P. DENARO and JACQUES BESER Sep. 1986 128 p. (Contract NAS2-11791) (NASA-CR-177443; NAS 1.26:177443) Avail: NTIS HC A07/MF A01 CSCL 17G

Several areas were investigated for improving vertical accuracy for a rotorcraft using the differential Global Positioning System (GPS) during a landing approach. Continuous deltaranging was studied and the potential improvement achieved by estimating acceleration was studied by comparing the performance on a constant acceleration turn and a rough landing profile of several

filters: a position-velocity (PV) filter, a position-velocity-constant acceleration (PVAC) filter, and a position-velocity-turning acceleration (PVAT) filter. In overall statistics, the PVAC filter was found to be most efficient with the more complex PVAT performing equally well. Vertical performance was not significantly different among the filters. Satellite selection algorithms based on vertical errors only (vertical dilution of precision or VDOP) and even-weighted cross-track and vertical errors (XVDOP) were tested. The inclusion of an altimeter was studied by modifying the PVAC filter to include a baro bias estimate. Improved vertical accuracy during degraded DOP conditions resulted. Flight test results for raw differential results excluding filter effects indicated that the differential performance significantly improved overall navigation accuracy. A landing glidepath steering algorithm was devised which exploits the flexibility of GPS in determining precise relative position. A method for propagating the steering command over the GPS update interval was implemented. J.P.B.

NAVSIM 2: A COMPUTER PROGRAM FOR SIMULATING AIDED-INERTIAL NAVIGATION FOR AIRCRAFT

WILLIAM S. BJORKMAN Mar. 1987 94 p
(Contract NAS2-10850)
(NASA-CR-177438; NAS 1.26:177438) Avail: NTIS HC A05/MF A01 CSCL 17G

NAVSIM II, a computer program for analytical simulation of aided-inertial navigation for aircraft, is described. The description is supported by a discussion of the program's application to the design and analysis of aided-inertial navigation systems as well as instructions for utilizing the program and for modifying it to accommodate new models, constraints, algorithms and scenarios. NAVSIM II simulates an airborne inertial navigation system built around a strapped-down inertial measurement unit and aided in its function by GPS, Doppler radar, altimeter, airspeed, and position-fix measurements. The measurements are incorporated into the navigation estimate via a UD-form Kalman filter. The simulation was designed and implemented using structured programming techniques and with particular attention to user-friendly operation. Author

SIMULATION OF AN ENHANCED TCAS 2 SYSTEM IN OPERATION Semiannual Report

R. G. ROJAS, P. LAW, and W. D. BURNSIDE Oct. 1987 79 p
(Contract NSG-1498)
(NASA-CR-181545; NAS 1.26:181545; ESL-716199-9) Avail: NTIS HC A05/MF A01 CSCL 17G

Described is a computer simulation of a Boeing 737 aircraft equipped with an enhanced Traffic and Collision Avoidance System (TCAS II). In particular, an algorithm is developed which permits the computer simulation of the tracking of a target airplane by a Boeing 373 which has a TCAS II array mounted on top of its fuselage. This algorithm has four main components: namely, the target path, the noise source, the alpha-beta filter, and threat detection. The implementation of each of these four components is described. Furthermore, the areas where the present algorithm needs to be improved are also mentioned. Author

THE CREST SYSTEM DESIGN

DOUGLAS E. SWANSON and GERALD F. HERNDON (Boeing Military Airplane Co., Seattle, WA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings . Newhall, CA, SAFE Association, 1987, p. 27-31.

An adaptive performance ejection seat is developed and demonstrated. Key elements of this system include selectable thrust/attitude control rockets, adaptive restraint, windblast protection, digital flight control, controllable catapult, advanced sensors, and advanced composite structure. This paper presents the system design philosophy, the baseline design concept, and the rationale for subsystem selection. Author

THE CREST SEAT STRUCTURE DEVELOPMENT

GERALD F. HERNDON and DOUGLAS E. SWANSON (Boeing Military Airplane Co., Seattle, WA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings . Newhall, CA, SAFE Association, 1987, p. 39-43.

The advanced composite seat structure of the CREST escape system is discussed. The system incorporates an advanced composite shell structure that consolidates all of the pertinent subsystems into an ejection seat designed to support, position, and restrain a crew member in an aircraft cockpit during normal flight operations and provide support, restraint, and windblast protection during an emergency escape ejection episode. The baseline design concept, structural analysis techniques and results, and special manufacturing considerations for the structure are examined. C.D.

A88-13384

THE CREST WINDBLAST PROTECTION SYSTEM DESIGN

SAMUEL T. MAYNARD and DOUGLAS E. SWANSON (Boeing Military Airplane Co., Seattle, WA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings . Newhall, CA, SAFE Association, 1987, p. 44-47. refs

The design characteristics and rationale used for selecting a CREST windblast protection system configuration are discussed. The head/upper extremity protection subassembly and the lower extremity protection subassembly are described. Transonic and subsonic wind tunnel tests which demonstrate the effectiveness of this system under high and low speed conditions are reviewed. C.D.

A88-13391

INTRODUCING THE MK15 EJECTION SEAT

BRIAN A. MILLER (Martin-Baker Aircraft Co., Ltd., Higher Denham, England) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings . Newhall, CA, SAFE Association, 1987, p. 106-111.

The case for ejection seats in turboprop trainer aircraft is reviewed, and the Mk15 ejection seat system is described. The main problem areas addressed in developing this system are discussed, including those related to eye position and sitting position, maintaining ejection path clearance and assuming minimal airframe changes resulting from the installation of the system, affording maximum pilot field of view and canopy bow clearance, and minimizing weight. The mode of operation of the system and the resulting stable trajectory are described. C.D.

CREST FLIGHT CONTROLLER

F. D. N. GOULD, J. W. MACHIA, and I. S. MEHDI (Boeing Military Airplane Co., Seattle, WA) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings . Newhall, CA, SAFE Association, 1987, p. 122-127.

The requirements and design details of the CREST Flight Controller hardware are described. The main controller, hand-off circuitry, backup sequencer, power supply, and flight data recorder are addressed. The software which performs the required built-in-test, normal flight, and crew escape functions is also described. C.D.

A88-13395

NACES - THE PROGRAM AND THE SEAT

BRIAN A. MILLER (Martin-Baker Aircraft Co., Ltd., Higher Denham, England) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings . Newhall, CA, SAFE Association, 1987, p. 134-139.

The development of the Navy Aircrew Common Ejection Seat (NACES) is discussed. The aspects of the project addressed here include cost, system performance, assurance of maintainability and reliability, minimizing of integrated logistic support/lifecycle costs, and ease of manufacture. The phases of the program are summarized, and a status report is given. C.D.

A88-13399

CHALLENGES OF DEVELOPING CONTROLLABLE PROPULSION FOR THE CREW ESCAPE TECHNOLOGIES (CREST) SEAT

W. L. GRASER, J. E. GLOD, and P. E. LUCAS (Morton Thiokol, Inc., Elkton, MD) IN: SAFE Association, Annual Symposium, 24th, San Antonio, TX, Dec. 11-13, 1986, Proceedings . Newhall, CA, SAFE Association, 1987, p. 168-173.

The CREST rocket motor assembly, which consists of two major subassemblies, the main thrust subassembly (MTS) and the attitude control subassembly (ACS), is discussed. The thrust vector nozzles, bit motors, manifold, and hydraulic power unit of the MTS are described. The gas generator design, hot gas valve, and hot gas tubing of the ACS are addressed. C.D.

A88-13539

NACES P3I AND BEYOND

BRIAN A. MILLER (Martin-Baker Aircraft Co., Ltd., Higher Denham, England) SAFE Journal, vol. 17, Fall 1987, p. 22-26.

The U.S. Navy aircrew common ejection seat (NACES) P3I program was created to enable the progressive updating of the baseline seat to ensure that it meets the state-of-the-art standards. Designated the Mk14, the ejection seat incorporates a modular design concept, with each subsystem largely self-contained and capable of improvement or replacement without affecting other subsystems. The P3I program implementation concept is discussed as well as Update I, automatic liferaft inflation, databus interlink, passive arm restraint, diversification, and repackaging. K.K.

A88-13540

ADVANCED TECHNOLOGY COCKPIT PROGRAM

JACOB EYTH, JR. (U.S. Navy, Naval Air Development Center, Warminster, PA) SAFE Journal, vol. 17, Fall 1987, p. 27-32.

The Advanced Technology Cockpit (ATC) Program, conducted by the Naval Air Development Center, was initiated in FY84 with the goal of redesigning the crewstation with primary emphasis on the pilot. The expected payoffs from using the ATC include improved high g onset and sustained g capability using articulating seat positioning, addition of laser protection through canopy filtering techniques, and improved man-machine interfaces through the use of voice interaction and decision aids. A transition from the 6.2 program to the 6.3 program is planned in FY88 for the development of a full-scale dynamic demonstrator. K.K.

A88-13973

INCLINED PLANES

IAN GOOLD Flight International (ISSN 0015-3710), vol. 132, Sept. 26, 1987, p. 34-38.

A study has been conducted under the aegis of NASA-Ames by several VTOL aircraft manufacturers, in order to ascertain the range of tilt-rotor aircraft sizes and configurations that might be economically accommodated by projected passenger market trends. Attention was given to issues associated with aircraft and powerplant certification as well as the overall impact of such civilian aircraft production capacities on the defence industrial base. The tilt-rotor passenger aircraft sizes considered are capable of accommodating 8, 19, 31, 39, and 75 seats. The 31- and 39-seat aircraft are variants of the V-22 Osprey; of these, the smaller is unpressurized, while the larger employs a fully pressurized fuselage. O.C.

INTEGRATING NONLINEAR AERODYNAMIC AND STRUCTURAL ANALYSIS FOR A COMPLETE FIGHTER CONFIGURATION

KENNETH E. TATUM (PRC Kentron, Inc., Hampton, VA) and GARY L. GILES (NASA, Langley Research Center, Hampton, VA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 10 p. refs (AIAA PAPER 87-2863)

The coupling of a nonlinear aerodynamics program with a structural analysis program to include the effects of static aeroelasticity in early preliminary design studies is described. A nonlinear, full potential aerodynamics method with capability to model geometric details of a complete aircraft in supersonic flow is used. The deflections of the lifting surfaces are calculated using an equivalent plate structural representation which can readily accommodate the changes in stiffness and geometric properties required during the preliminary design process. An iterative solution procedure is used to obtain consistent aerodynamic loads and structural deflections at the specified flight conditions. The volume of data transmitted between programs is minimized. The procedure is applied to a complete aircraft and the numerical results illustrate the aeroelastic effects on pressure distribution as well as total forces and moments. During this design study, the thickness distribution of the wing cover skins was initially sized based on rigid loads and subsequently resized under aeroelastic loads. Comparisons are made between these nonlinear aeroelastic results and results obtained from linear aerodynamic methods applied to a rigid shape during conceptual design studies. Author

EXPLOITING THE CLOSE-COUPLED CANARD

J. D. MARTIN (Embry-Riddle Aeronautical University, Daytona Beach, FL) and N. R. FOSTER (Development Engineering Resources, Inc., Port Orange, FL) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 7 p. refs (AIAA PAPER 87-2864)

Canard, tandem wing, and three surface aircraft configurations are popular subjects of analytical and windtunnel studies. This paper describes an approach for exploiting the aerodynamic advantages of a close-coupled wing and canard while minimizing the disadvantages. A mission statement was formulated; a preliminary close-coupled canard configuration was established; windtunnel testing was conducted to verify previous study results and new design characteristics; and finally, the close-coupled canard concept was committed to structural design and fabrication. Proof-of-concept flight-test is scheduled for Spring 1988 while research investigations using this subsonic technology demonstration vehicle will extend into 1990. In addition to demonstrating performance and flight handling qualities, unique airframe modularity permits exploration of alternate configurations. Author

A88-14254#**A METHOD TO OPTIMIZE NACELLE SHAPE IN A SUPERSONIC CRUISE AIRCRAFT**

REINER SUKAT and SAEED FAROKHI (Kansas, University, Lawrence) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 8 p. refs

(AIAA PAPER 87-2865)

A computer program is developed to optimize the shape of a nacelle installed in a supersonic aircraft for minimum drag. The program is also capable of optimizing the wing camber of the same aircraft. As a unique feature, the present code accounts for the aerodynamic forces on the entire airplane, in contrast to previous wing camber optimization codes which included only the wing forces. The program is based on a panel method analysis code by Woodward and the accuracy of the program is checked with the available wind tunnel data on isolated components as well as full configurations. The computed results are in general agreement with the available data. The results of several optimization test runs are presented and show agreement with trends predicted by other researchers based on theoretical and experimental studies. At higher angles of attack, when supersonic vortex lift becomes significant, the analysis code underpredicts the aircraft lift coefficient. Author

A88-14263#**A COMPARISON OF FLUTTER ANALYSES FOR A 45 DEG SWEEPED MODEL**

EDMUND PENDLETON, MARK FRENCH, and THOMAS NOLL (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 14 p. refs

(AIAA PAPER 87-2886)

This paper presents a comparison of results from subsonic and supersonic flutter analyses for a thin, swept wing wind tunnel model. Three computer codes, NASTRAN, FASTOP, and the new ASTROS computer code, were used to perform the analyses. The subsonic doublet lattice method and the supersonic Mach box method and Potential Gradient Method were utilized in these codes. The aim of this paper is to assist in identifying both the strengths and weaknesses in the flutter capability currently existing in government versions of these codes, and to point out possible improvements which may enhance the flutter capability in the still maturing ASTROS code. Author

A88-14266#**THE B. AE. HAWK - A FIRST DECADE OF DEVELOPMENT**

J. E. CHACKSFIELD (British Aerospace, PLC, Military Aircraft Div., Kingston-upon-Thames, England) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 7 p.

(AIAA PAPER 87-2911)

A development history and current status evaluation is presented for the Hawk family of jet-powered military trainers and light attack aircraft. The single-seat Hawk Mk. 200 variant of the Hawk Mk. 100 two-seat trainer incorporates radar equipment and guns in place of the forward cockpit; aerodynamic and Adour Mk 871 powerplant improvements over previous variants yield excellent hot/high condition mission effectiveness, together with enhancements of attack speed and agility. An 80-percent structural commonality is maintained between the Mk. 200 and the earlier Mk. 60 and Mk. 100 variants. O.C.

THE VALUE OF EARLY FLIGHT EVALUATION OF PROPULSION CONCEPTS USING THE NASA F-15 RESEARCH AIRPLANE

FRANK W. BURCHAM, JR. and RONALD J. RAY (NASA, Flight Research Center, Edwards, CA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 13 p. refs

(AIAA PAPER 87-2877)

The value of early flight evaluation of propulsion and propulsion control concepts was demonstrated on the NASA F-15 airplane in programs such as highly integrated digital electronic control (HIDEC), the F100 engine model derivative (EMD), and digital electronic engine control (DEEC). (In each case, the value of flight demonstration was conclusively demonstrated.) This paper describes these programs, and discusses the results that were not expected, based on ground test or analytical prediction. The role of flight demonstration in facilitating transfer of technology from the laboratory to operational airplanes is discussed. Author

A88-14269#**AERODYNAMIC INTEGRATION OF AFT-MOUNTED UHB PROPULSION SYSTEMS**

D. F. VERNON and J. P. HUGHES (Douglas Aircraft Co., Long Beach, CA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 12 p. refs

(AIAA PAPER 87-2920)

This paper discusses the aerodynamics issues accompanying aft-pylon-mount Ultra High Bypass (UHB) propulsion installations. An overview is presented of the design, testing, and analysis methods utilized to address these issues. Results from both low-speed and high-speed wind tunnel tests are used to validate several computational fluid dynamics (CFD) methods which address the issues critical to UHB/aircraft integration. Verification of the nacelle-pylon rigging and buffet performance is accomplished through the examination of lift, drag, pitching moment, and surface static pressure data. Qualitative aspects of aircraft and power induced flowfield interactions are provided using oil flow visualization techniques during wind tunnel testing as well as color graphics display of both experimental and calculated data. Details of pylon, fuselage, and wing wake effects on fan onset flow distortion are obtained through the use of a rotating nacelle based total pressure rake. The effect of power on aircraft performance predictions is addressed by definition of a viable thrust-drag accounting procedure which utilizes test results in conjunction with a theoretical blade performance method. Author

A88-14262#**THRUST SAVINGS LIMITATIONS WITH BLOWN HIGH LIFT WINGS**

J. L. LOTH and M. S. FUNK (West Virginia University, Morgantown) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 9 p. Research supported by Lockheed-Georgia Co. refs

(AIAA PAPER 87-2884)

In the present method for ascertaining the relationship between airframe aerodynamics and thrust requirements in powered high lift systems, attention is given to the minimum installed vector thrust that is required for equilibrium level flight. The available excess thrust for forward acceleration is integrated to provide both the transition time and total impulse required for horizontal acceleration from minimum liftoff speed to a reference velocity at which dynamic pressure equals wing loading. The easily interpreted results then appear as the thrust/weight ratio and a dimensionless flight speed. While various high lift systems have widely differing lift augmentation ratios, their transition flight performance is noted to be similar. O.C.

INSTALLATION OF INNOVATIVE TURBOFAN ENGINES ON CURRENT TRANSPORT AIRPLANES

MICHAEL G. DUNICAN (Boeing Commercial Airplane Co., Seattle, WA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 6 p. (AIAA PAPER 87-2921)

Modern turbofan engines with bypass ratios near 5:1 are reaching a fuel efficiency plateau. Further major improvements in these engines are unlikely because of practical limits to component efficiencies. One way to further reduce engine fuel consumption is to increase bypass ratio, which produces higher propulsive efficiency, but also increases power plant drag and weight. A study of the installation of higher bypass ratio engines on the 747 and 767 has been completed. The trades in engine fuel consumption, weight and drag have been evaluated and the installation constraints have been identified. Author

MD-11 DESIGN - EVOLUTION, NOT REVOLUTION

GEORGE G. FIELD (Douglas Aircraft Co., Long Beach, CA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 7 p. (AIAA PAPER 87-2928)

A tradeoff/benefit evaluation is conducted for a 1990-marketable derivative of a current airliner design. The MD-11 is derived from the DC-10 Series 30 aircraft by way of changes which significantly improve aerodynamic performance; in addition, more advanced engines, cockpit systems and cabin interior configuration concepts are incorporated. The retention of the basic DC-10 structure and components, which have known operational, reliability, and manufacturing cost characteristics, thereby forms the basis for an economically successful evolutionary design. Both passenger and freighter versions are envisaged. O.C.

A88-14276#

FUSELAGE SELF-PROPULSION BY STATIC-PRESSURE THRUST - WIND-TUNNEL VERIFICATION

FABIO R. GOLDSCHMIED AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 21 p. refs (AIAA PAPER 87-2935)

The novel concept of body self-propulsion by static-pressure thrust has been introduced and verified in the wind-tunnel by direct integration of radial pressure distributions for self-propelled axisymmetric bodies with slot suction BLC and stern jet discharge. This concept also means that power can be supplied only to BLC, since the jet discharge is achieved at jet total-head equal to free-stream's; the skin-friction drag is offset entirely by the pressure thrust. It is the most efficient form of body self-propulsion. It also has been shown that 50 percent power reduction has been achieved as compared to the test body/wake-propeller NASA configuration, with only 15 percent of its mass flow. A total aircraft power reduction of 40 percent to 60 percent is feasible as compared to current General Aviation aircraft at 200 MPH cruise speed. Author

PRELIMINARY FLIGHT ASSESSMENT OF THE X-29A ADVANCED TECHNOLOGY DEMONSTRATOR

JOHN W. HICKS and NEIL W. MATHENY (NASA, Flight Research Center, Edwards, CA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 13 p. refs (AIAA PAPER 87-2949)

Several new technologies integrated on the X-29A advanced technology demonstrator are being evaluated for the next generation of fighter aircraft. Some of the most noteworthy ones are the forward-swept wing, digital fly-by-wire flight control system, close-coupled wing-canard configuration, aeroelastically tailored composite wing skins, three-surface pitch control configuration, and a highly unstable airframe. The expansion of the aircraft 1-g

and maneuver flight envelopes was recently completed over a two-year period in 84 flights. Overall flight results confirmed the viability of the aircraft design, and good agreement with preflight predictions was obtained. The individual technologies' operational workability and performance were confirmed. This paper deals with the flight test results and the preliminary evaluation of the X-29A design and technologies. A summary of the primary technical findings in structural static loads, structural dynamic characteristics, flight control system characteristics, aerodynamic stability and control, and aerodynamic performance is presented. Author

THE PAYOFF OF A DEDICATED FLIGHT TEST AIRCRAFT FOR THE MD-80 FAMILY

HAROLD K. CHENEY and CHARLES F. HOLZER (Douglas Aircraft Co., Long Beach, CA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 6 p. (AIAA PAPER 87-2950)

For the MD-80 family of commercial aircraft, Fuselage 909 was dedicated to flight test aircraft improvements. Following the use of 909 for the FAA certification demonstrations of the MD-81 version, the aircraft was assigned to the overall MD-80 program, and used to test a number of improvement items developed before certification by the FAA. This saved the time and expense of instrumenting and using production aircraft for these tasks. Nearly all of the MD-83 development and certification flight testing was accomplished using 909. In supporting the MD-80 family of derivative aircraft, 909 has flown 1,660 flights and 2,440 flight hours. Currently, it is embarking on its latest adventure of confirming the concept of the ultra-high-bypass-ratio propulsion system. This paper summarizes the accomplishments of Fuselage 909 and the payoffs obtained from use of this dedicated test aircraft in development of a family of derivative aircraft. Author

COMPROMISE - AN EFFECTIVE APPROACH FOR CONCEPTUAL AIRCRAFT DESIGN

FARROKH MISTREE (Houston, University, TX), STERGIOS MARINOPOULOS, DAVID JACKSON, and JON SHUPE AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 12 p. refs (Contract NAS1-18117) (AIAA PAPER 87-2965)

The Decision Support Problem (DSP) technique for aircraft design is presently demonstrated through the development of a compromise DSP template for the conceptual design of subsonic transport aircraft. System variables are wing span and area, fuselage diameter and length, takeoff weight, and installed thrust. Such system constraints as range and wing loading are represented algebraically using standard subsonic aircraft theory, and economic efficiency is modeled in terms of rates-of-return. The DSP template thus obtained has been tested and validated using the known mission requirements and design constants of the B 727-200 airliner. O.C.

A88-14305

THE DESIGN, DEVELOPMENT AND CONSTRUCTION OF THE UM10 ULTRALIGHT NON-RIGID AIRSHIP

THOMAS S. BERGER (Ulita Manufacturing Co., Sheboygan, WI) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 1. London, Royal Aeronautical Society, 1986, p. 5.1 to 5.11.

Configurational design features and performance projections are presented for the small, lightweight UM10 nonrigid airship, with attention to propulsion system configuration and control car structure and empennage support details. The UM10 is envisioned as a platform for LTA vehicle flight crew training, commercial advertising, and aerial photography. It is noted to incorporate as its most advanced feature a pair of vectoring thrusters, mounted on outriggers attached to the control car. O.C.

A88-14307**A FLYING SAUCER??? YOU ARE CRAZY!!!**

MARIO SANCHEZ ROLDAN (Spacial, Mexico) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 1. London, Royal Aeronautical Society, 1986, p. 9.1 to 9.5.

An account is given of the results of ten years of research efforts and four years of prototype construction activities for geodetic-frame lenticular rigid airships. The first prototype built was destroyed by storm damage to its hangar. The present prototype employs six gas cells within the rigid envelope, and incorporates two 90-hp engines on either side of the craft behind the gondola. The entire engine/propeller unit can be swiveled 110 deg down and 30 deg up, in order to furnish greater controllability at low speeds. An on-board microprocessor is used for control system automation. O.C.

A88-14316**TOROIDAL BALLOON CONCEPT**

F. TODD (Todd Transport Design, Canada) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 19.1 to 19.10.

The toroidal balloon concept (TBC) applies to a semirigid airship using a toroidal flexible envelope with a rigid structure carrying a propeller/fan propulsion system at its center together with cabin, control systems, and landing gears. In order to be able to haul a 20-ton payload, a TBC would have a 200-ft overall diameter, together with a 40-ft duct/fan propulsion system that was driven by turboshaft powerplant(s) generating a total of 8000 SHP. Attention is given to comparisons between TBC and helicopter performance in several typical missions. O.C.

A88-14317**THE CASE FOR A SOLAR POWERED AIRSHIP**

GABRIEL A. KHOURY (Imperial College of Science and Technology, London, England) IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 20.1 to 20.61. refs

A comprehensive design feasibility study is conducted for a 80-m long, solar-cell powered airship incorporating state-of-the-art structures, materials, control, and propulsion resources with equally advanced photovoltaic, electrical powertrain, and energy storage systems. Attention is given to the mounting of solar cell arrays on the airship hull surfaces, seasonal and geographical latitude effects, performance projections under various insolation conditions, and the flywheel, storage battery and fuel cell alternatives for energy storage. Detailed calculations of energy economies are presented. O.C.

A88-14370**X-31A**

WOLFGANG B. HERBST (Messerschmitt-Boelkow-Blohm GmbH, Munich, Federal Republic of Germany) SAE, Aerospace Vehicle Conference, Washington, DC, June 8-10, 1987. 8 p. (SAE PAPER 871346)

A West German/USA experimental aircraft program has been instituted to develop the technology base of 'supermaneuverability' characteristics; the extension of fighter aircraft maneuver envelope that this represents calls for a pushing back of the stall barrier to as much as 70-deg angle-of-attack. The unprecedentedly small turn radii thus generated will be the basis of three-dimensional maneuvers of great tactical significance in future air combat with 'all-aspect' weapons. The key to supermaneuverability is thrust vectoring in pitch and yaw; this also enhances the decoupling of fuselage gun aiming and flight path control. O.C.

FLIGHT RESEARCH WITH THE MIT DAEDALUS PROTOTYPE
STEVEN R. BUSSOLARI, HAROLD H. YOUNGREN (MIT, Cambridge, MA), and JOHN S. LANGFORD (Institute for Defense Analyses, Alexandria, VA) SAE, Aerospace Vehicle Conference, Washington, DC, June 8-10, 1987. 9 p. NASA-USAF-supported research. refs
(SAE PAPER 871350)

The MIT Light Eagle human-powered aircraft underwent long-duration testing over Rogers Dry Lake in California during January, 1987. Designed as a prototype for the MIT Daedalus Project, the Light Eagle's forty-eight flights provided pilot training, established new distance records for human-powered flight, and provided quantitative data through a series of instrumented flight experiments. The experiments focused on: (1) evaluating physiological loads on the pilot, (2) determining airframe power requirements, and (3) developing an electronic flight control system. This paper discusses the flight test program, its results and their implications for the follow-on Daedalus aircraft, and the potential uses of the Light Eagle as a low Reynolds number testbed.

A88-15226**IN-FLIGHT THRUST DETERMINATION AND UNCERTAINTY**

Warrendale, PA, Society of Automotive Engineers, Inc. (SAE SP-674), 1986, 412 p. For individual items see A88-15227 to A88-15228.

(SAE SP-674)

The conference presents papers on in-flight thrust determination, the uncertainty of in-flight thrust determination, and the measurement evaluation process used in propulsion ground test facilities. Other topics include the development of in-flight thrust measurement procedures for an afterburning turbofan engine, and measurement uncertainty methodology. Consideration is also given to the uncertainty methodology for in-flight thrust determination. K.K.

IN-FLIGHT THRUST DETERMINATION

ROBERT B. ABERNETHY (Pratt and Whitney, East Hartford, CT), GARY R. ADAMS (USAF, Wright-Patterson AFB, OH), JOHN C. ASCOUGH (Royal Aircraft Establishment, Farnborough, England), JENNIFER L. BAER-RIEDHART (NASA, Flight Research Center, Edwards, CA), GEORGE H. BALKCOM (General Dynamics Corp., Saint Louis, MO), THOMAS BIESIADNY (NASA, Lewis Research Center, Cleveland, OH) et al. (SAE Aerospace Information Report, SAE AIR 1703, Nov. 1985) IN: In-flight thrust determination and uncertainty. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, 234 p. refs
(SAE AIR 1703)

The major aspects of processes that may be used for the determination of in-flight thrust are reviewed. Basic definitions are presented as well as analytical and ground-test methods for gathering data and calculating the thrust of the propulsion system during the flight development program of the aircraft. Test analysis examples include a single-exhaust turbofan, an intermediate-cowl turbofan, and a mixed-flow afterburning turbofan. K.K.

A88-15228* Pratt and Whitney Aircraft, East Hartford, Conn.

UNCERTAINTY OF IN-FLIGHT THRUST DETERMINATION

ROBERT B. ABERNETHY (Pratt and Whitney, East Hartford, CT), GARY R. ADAMS (USAF, Wright-Patterson AFB, OH), JOHN W. STEURER (McDonnell Douglas Co., Saint Louis, MO), JOHN C. ASCOUGH (Royal Aircraft Establishment, Farnborough, England), JENNIFER L. BAER-RIEDHART (NASA, Flight Research Center, Edwards, CA), GEORGE H. BALKCOM (General Dynamics Corp., Saint Louis, MO), THOMAS BIESIADNY (NASA, Lewis Research Center, Cleveland, OH) et al. (SAE Aerospace Information Report, SAE AIR 1678, Aug. 1985) IN: In-flight thrust determination and uncertainty. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 243-338. refs (SAE AIR 1678)

Methods for estimating the measurement error or uncertainty of in-flight thrust determination in aircraft employing conventional turbofan/turbojet engines are reviewed. While the term 'in-flight thrust determination' is used synonymously with 'in-flight thrust measurement', in-flight thrust is not directly measured but is determined or calculated using mathematical modeling relationships between in-flight thrust and various direct measurements of physical quantities. The in-flight thrust determination process incorporates both ground testing and flight testing. The present text is divided into the following categories: measurement uncertainty methodology and in-flight thrust measurement processes. K.K.

FUTURE AIRLINER COCKPITS

PIERRE CONDOM Interavia (ISSN 0020-5168), vol. 42, Oct. 1987, p. 1089-1092.

The current A320 airliner cockpit typifies state-of-the-art crew interfaces with their aircraft. The instrument panel is a six-CRT display that provides flight and navigation data in addition to monitoring data for engines and systems. Two other CRTs are associated with the flight management system. Control columns and wheels have been replaced by miniature side-sticks that leave an uninterrupted view of the instrument panel. Attention is presently given to NASA-sponsored technological forecasts concerning the nature of cockpit systems that may enter service beyond 1995. Preprogrammed information-selection will be featured by the multifunctional display panels foreseen. HUDs will also be incorporated for superior operation in runway takeoff/landing approach environments. O.C.

TECHNOLOGY CHALLENGES FOR THE NATIONAL AERO-SPACE PLANE

WILLIAM M. PILAND (NASA, National Aero-Space Plane Program Management Office, Washington, DC) IAF, International Astronautical Congress, 38th, Brighton, England, Oct. 10-17, 1987. 10 p. (IAF PAPER 87-205)

The National Aerospace Plane (NASP) will require an exceptionally high degree of integration between propulsion and aerodynamic configuration, in order to achieve the requisite specific impulse and low structural weight. This is to be achieved through the use of forebody shock compression and afterbody exhaust expansion. Attention is presently given to the materials and structural concepts required for the realization of these NASP airframe functions, in view of the exceptionally high aerothermodynamic loads that will be experienced at hypersonic speeds. Active cooling will have to be used in certain critical airframe and propulsion components. CFD characterizations of these processes must be carefully developed and fully validated. O.C.

LIGHT AIRCRAFT SOUND TRANSMISSION STUDIES - NOISE REDUCTION MODEL

MAHABIR S. ATWAL (Paul S. Veneklasen and Associates, Santa Monica, CA), KAREN E. HEITMAN (NASA, Langley Research Center; U.S. Army, Aerostructures Directorate, Hampton, VA), and MALCOLM J. CROCKER (Auburn University, AL) Acoustical Society of America, Journal (ISSN 0001-4966), vol. 82, Oct. 1987, p. 1342-1348. refs

Experimental tests conducted on the fuselage of a single-engine Piper Cherokee light aircraft suggest that the cabin interior noise can be reduced by increasing the transmission loss of the dominant sound transmission paths and/or by increasing the cabin interior sound absorption. The validity of using a simple room equation

model to predict the cabin interior sound-pressure level for different fuselage and exterior sound field conditions is also presented. The room equation model is based on the sound power flow balance for the cabin space and utilizes the measured transmitted sound intensity data. The room equation model predictions were considered good enough to be used for preliminary acoustical design studies.

THE DESIGN OF A JOINED WING FLIGHT DEMONSTRATOR AIRCRAFT

S. C. SMITH, S. E. CLIFF (NASA, Ames Research Center, Moffett Field, CA), and I. M. KROO (Stanford University, CA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 16 p. refs (AIAA PAPER 87-2930)

A joined-wing flight demonstrator aircraft has been developed at the NASA Ames Research Center in collaboration with ACA Industries. The aircraft is designed to utilize the fuselage, engines, and undercarriage of the existing NASA AD-1 flight demonstrator aircraft. The design objectives, methods, constraints, and the resulting aircraft design, called the JW-1, are presented. A wind-tunnel model of the JW-1 was tested in the NASA Ames 12-foot wind tunnel. The test results indicate that the JW-1 has satisfactory flying qualities for a flight demonstrator aircraft. Good agreement of test results with design predictions confirmed the validity of the design methods used for application to joined-wing configurations.

MODELS FOR EVALUATING THE PERFORMANCE OF PROPELLER AIRCRAFT ACTIVE NOISE CONTROL SYSTEMS

A. J. BULLMORE, P. A. NELSON, S. J. ELLIOTT (Southampton, University, England), J. F. EVERS, and B. CHIDLEY (British Aerospace, PLC, Manchester, England) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 12 p. refs (AIAA PAPER 87-2704)

A simple analytical theory is used to model the fuselage structural response of a B.Ae.748 aircraft as that of a finite, isotropic thin cylindrical shell, and the cabin acoustic response as that of a cylindrical room. Theoretical results are compared with measured flight data obtained on the test aircraft. It is shown that, provided the theoretical external acoustic pressure forcing of the shell is representative of the measured propeller pressure field acting on the aircraft fuselage, then the simple model can yield structural and acoustic responses which show good agreement with the measured data. This model is used to predict the effectiveness of an 8 source/24 error sensor active control system when applied to the predicted cabin sound fields at the first (88 Hz) and second (176 Hz) blade passage harmonic frequencies. It is attempted to reduce the average sound levels over a head height plane covering all the seats. Average reductions over the plane of the order of 8 dB for the fundamental frequency and 2 dB for the second harmonic frequency are predicted. These results involve local reductions of up to 35 dB, but the spatial extent of these zones of high level reductions are shown to be smaller for the second harmonic frequency than the fundamental frequency.

DIGITAL CONTROL OF SOUND FIELDS IN THREE-DIMENSIONAL ENCLOSURES

J. V. WARNER and R. J. BERNHARD (Purdue University, West Lafayette, IN) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 9 p. refs (Contract NSF MSM-85-05834) (AIAA PAPER 87-2706)

Active noise control has been shown to be a promising solution for reducing noise levels in turboprop aircraft. This paper presents a broad-band active noise control system based upon an off-line frequency domain model obtained from system response measurements. A laboratory test in an 18 passenger airplane fuselage resulted in 10-20 dB reduction of broad-band deterministic

noise over a substantial frequency range. However, the sensitivity of the system to environmental changes proved the impracticality of using off-line modeling techniques. Therefore, this paper also presents the results of a simulation study of adaptive active noise control in aircraft. Actual system response measurements of the aircraft were used to simulate the system. The Least Mean Square (LMS) and Recursive Least Mean Square (RLMS) gradient search techniques were found to be equally capable of modeling the airplane system. Both methods produced at least 10 dB attenuation of broad-band random noise. However, for a dense harmonic sound field, the LMS estimator was superior, attenuating most harmonics by more than 30 dB, where the RLMS estimator reduced most harmonics by only 20 dB. Practical implications of control loop delay on cancellation of non-deterministic sound are also discussed.

MEASUREMENTS OF PROPELLER NOISE IN A LIGHT TURBOPROP AIRPLANE

J. F. WILBY and E. G. WILBY (Astron Research and Engineering, Santa Monica, CA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 11 p. NASA-supported research. refs (AIAA PAPER 87-2737)

In-flight acoustic measurements have been made on the exterior and interior of a twin-engined turboprop airplane under controlled conditions to study data repeatability. It is found that the variability of the harmonic sound pressure levels in the cabin is greater than that for the exterior sound pressure levels, typical values for the standard deviation being +2.0 dB and -4.2 dB for the interior, versus +1.4 dB and -2.3 dB for the exterior. When insertion losses are determined for acoustic treatments in the cabin, the standard deviations of the data are typically + or - 6.5 dB. It is concluded that additional factors, such as accurate and repeatable selection of relative phase between propellers, controlled cabin-air-temperatures, installation of baseline acoustic absorption, and measurement of aircraft attitude, should be considered in order to reduce uncertainty in the measured data.

HYPERSONIC STRUCTURES AND MATERIALS - A PROGRESS REPORT

L. ROBERT JACKSON, SIDNEY C. DIXON, DARREL R. TENNEY (NASA, Langley Research Center, Hampton, VA), ALAN L. CARTER (NASA, Ames Research Center, Moffett Field, CA), and JOSEPH R. STEPHENS (NASA, Lewis Research Center, Cleveland, OH) Aerospace America (ISSN 0740-722X), vol. 25, Oct. 1987, p. 24, 25, 28-30.

The weight of a hypersonic, airbreathing SSTO vehicle may be more critical than for any previous aerospacecraft; an evaluation is accordingly made of the development status and applicability of intermetallic compounds, metal-matrix composites, carbon-carbon composites, ceramics, and ceramic-matrix composites applicable to SSTO craft primary structures. Aerothermal, aerothermoelastic, and acoustic loads are high because the airbreathing SSTO vehicle must follow a high dynamic pressure trajectory in order to achieve the requisite propulsive efficiency. Attention is given to the prospects for integral cryogenic tankage and actively hydrogen-cooled airframe and engine structures.

IMPROVEMENTS TO THE ADAPTIVE MANEUVERING LOGIC PROGRAM Final Report

GEORGE H. BURGIN Washington Jun. 1986 189 p (Contract NAS2-11421)

(NASA-CR-3985; H-1303; NAS 1.26:3985) Avail: NTIS HC A09/MF A01 CSCL 01C

The Adaptive Maneuvering Logic (AML) computer program simulates close-in, one-on-one air-to-air combat between two fighter aircraft. Three important improvements are described. First, the

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE

previously available versions of AML were examined for their suitability as a baseline program. The selected program was then revised to eliminate some programming bugs which were uncovered over the years. A listing of this baseline program is included. Second, the equations governing the motion of the aircraft were completely revised. This resulted in a model with substantially higher fidelity than the original equations of motion provided. It also completely eliminated the over-the-top problem, which occurred in the older versions when the AML-driven aircraft attempted a vertical or near vertical loop. Third, the requirements for a versatile generic, yet realistic, aircraft model were studied and implemented in the program. The report contains detailed tables which make the generic aircraft to be either a modern, high performance aircraft, an older high performance aircraft, or a previous generation jet fighter. Author

ROTORCRAFT DESIGN FOR OPERATIONS

Jun. 1987 319 p In ENGLISH and FRENCH Symposium held in Amsterdam, Netherlands, 13-16 Oct. 1986 (AGARD-CP-423; ISBN-92-835-0420-8) Avail: NTIS HC A14/MF A01

The objective was to explore the impact of operational needs on the evolution of rotorcraft design. The status of rotorcraft design is reviewed and priorities and neglected topics are discussed.

N88-11650# Army Aviation Systems Command, St. Louis, Mo. **THE INFLUENCE OF OPERATIONAL REQUIREMENTS ON LHX CONCEPT FORMULATION**

ROBERT D. HUBBARD and ROBERT L. TOMAINE In AGARD, Rotorcraft Design for Operations 8 p Jun. 1987

Avail: NTIS HC A14/MF A01

The U.S. Army's Light Helicopter Family (LHX) program which is currently in concept formation is discussed. The activities associated with concept formation including governing regulations, how the process is executed, the scope of the effort involved and innovations included for LHX are discussed. The evolution of the requirements is emphasized and the focus is on how the operational requirements drive the engineering requirements and ultimately the design of the aircraft. Operational requirements are driven by the LHX concept, namely, a family of Scout/Attack (LHX/SCAT) and Utility (LHX-U) aircraft with common dynamic components, core mission equipment and common subsystems. The impacts of the unique LHX-SCAT aircraft on the design of and commonality with the LHX-U are discussed. The operational requirements are categorized into those associated with the Army 21 concept of the future battlefield, the threat, safety and reliability, and availability and maintainability. Each category results in several specific design impacts. Author

N88-11651# KLM Helikopters B.V., Amsterdam (Netherlands). **DESIGN REQUIREMENTS FOR FUTURE COMMERCIAL OPERATIONS**

F. F. J. SCHAPER In AGARD, Rotorcraft Design for Operations 14 p Jun. 1987

Avail: NTIS HC A14/MF A01

Design requirements for helicopters stemming from civil operations are discussed. The offshore oil and gas industry is and will continue to be the main application of civil helicopters. Development of other commercial markets will require major improvements in almost all areas. Some of these areas are highlighted, including: safety, reliability, cockpit ergonomics, and vibration. The current rate of progress is considered to be much too slow and concern is expressed about military and civil requirements drifting too far apart. Designers of new military helicopters should be aware of these civil requirements and take them into account as much as possible. Author

MODELING XV-15 TILT-ROTOR AIRCRAFT DYNAMICS BY FREQUENCY AND TIME-DOMAIN IDENTIFICATION TECHNIQUES

MARK B. TISCHLER and JUERGEN KALETKA (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick, West Germany) In AGARD, Rotorcraft Design for Operations 20 p Jun. 1987

Avail: NTIS HC A14/MF A01

Models of the open-loop hover dynamics of the XV-15 Tilt-Rotor Aircraft are extracted from flight data using two approaches: frequency domain and time-domain identification. Both approaches are reviewed and the identification results are presented and compared in detail. The extracted models are compared favorably, with the differences associated mostly with the inherent weighing of each technique. Step responses are used to show that the predictive capability of the models from both techniques is excellent. Based on the results of this study, the relative strengths and weaknesses of the frequency and time-domain techniques are summarized and a proposal for a coordinated parameter identification approach is presented. ROTORCRAFT DESIGNS FOR THE YEAR 2000

EVAN A. FRADENBURGH /in AGARD, Rotorcraft Design for Operations 11 p Jun. 1987
 Avail: NTIS HC A14/MF A01

Some of the rotorcraft concepts that can offer higher speeds than the pure helicopter, including the compound helicopter, ABC, tilt-rotor, X-wing, and stowed rotor configurations are discussed. All of these are potentially practical aircraft. Economic considerations will dictate that the pure helicopter is here to stay; higher speed rotorcraft are not as cost effective at short distances. Also examined is the approach to helicopter sizing for heavy-lift applications. It is concluded that a super-large helicopter, sized to carry the heaviest payload needed, is unaffordable. A better solution is to develop a moderately large helicopter that will carry most of the required loads, and to use the twin-lift technique to transport the occasional extra-heavy load. Author

A129 ADVANCED SOLUTIONS FOR MEETING TODAY'S COMBAT HELICOPTER REQUIREMENT

GIUSEPPE VIRTUANI /in AGARD, Rotorcraft Design for Operations 9 p Jun. 1987
 Avail: NTIS HC A14/MF A01

It is argued that the A129 light attack helicopter represents the answer to modern and severe operational requirements. The main rotor hub and transmission are described as examples of unconventional and advanced technology design. The engine installation represents the case of a configuration where the operative requirement induced a deep physical integration among the subsystems. The large computer structure, the integrated multiplexing system based on the multiplexing and microprocessor technologies, constitutes a major example of functional integration between the helicopter and mission subsystem. THE EH-101 INTEGRATED PROJECT: A NAVAL, UTILITY AND COMMERCIAL HELICOPTER SYSTEM

PIETRO ALLI, RUGGERO BALDASSARRINI, GIOVANNI MARZORATI, GIOVANNI PAGLIARO, and LUCIANO ARMITI /in AGARD, Rotorcraft Design for Operations Jun. 1987
 Avail: NTIS HC A14/MF A01

The Royal Navy and Marina Militare Italiana tasked EHI to develop a new shipborne helicopter. The two Navies defined a common set of requirements related to the basic common helicopter plus a dedicated different set for each specific mission. Concurrently EHI performed autonomous research on the potential EH 101 civil and utility market. Through those analysis EHI came to the conclusion that a common basic helicopter could satisfy all of the requirements even if the roles were sometimes very different. The rationale and the trade off approach which were successfully devised and implemented to produce an aircraft with the best compromise of performance and cost are given. Author

ANALYTIC INVESTIGATION OF HELICOPTER ROTOR BLADE APPENDED AEROELASTIC DEVICES

RICHARD L. BIELAWA Feb. 1984 96 p
 (Contract NAS2-11008)
 (NASA-CR-166525; NAS 1.26:166525; UTRC-R84-915774-24)
 Avail: NTIS HC A05/MF A01 CSCL 01C

Analytic evaluations of four different passive aeroelastic devices appended to helicopter rotor blades are presented. The devices consist of a passive tuned tab, a control coupled tab, an all-flying tip and a harmonic dilational airfoil tip. Each device was conceived for improving either aerodynamic performance or reducing vibratory control loads or hub shears. The evaluation was performed using a comprehensive rotor aeroelastic analysis (the G400PA code with appropriate modifications), together with data for a realistic helicopter rotor blade (the UH-60A Blackhawk), in high speed flight (90 m/s, 175 kts). The results of this study show that significant performance ($L/(D \text{ sub } e)$) gains can be achieved with the all-flying free tip. Results from the harmonic dilational airfoil tip show the potential for moderate improvements in $L/(D \text{ sub } e)$. Finally, the results for the passive tuned tab and the control coupled tab, as configured for this study, show these devices to be impractical. Sections are included which describe the operation of each device, the required G400PA modifications, and the detailed results obtained for each device. Author

EFFECT OF MOTION CUES DURING COMPLEX CURVED APPROACH AND LANDING TASKS: A PILOTED SIMULATION STUDY

CHARLES H. SCANLON (Arkansas State Univ., State University.)
Dec. 1987 28 p
(Contract NCC1-107)
(NASA-TP-2773; L-16351; NAS 1.60:2773) Avail: NTIS HC A03/MF A01 CSCL 01C

A piloted simulation study was conducted to examine the effect of motion cues using a high fidelity simulation of commercial aircraft during the performance of complex approach and landing tasks in the Microwave Landing System (MLS) signal environment. The data from these tests indicate that in a high complexity MLS approach task with moderate turbulence and wind, the pilot uses motion cues to improve path tracking performance. No significant differences in tracking accuracy were noted for the low and medium complexity tasks, regardless of the presence of motion cues. Higher control input rates were measured for all tasks when motion was used. Pilot eye scan, as measured by instrument dwell time, was faster when motion cues were used regardless of the complexity of the approach tasks. Pilot comments indicated a preference for motion. With motion cues, pilots appeared to work harder in all levels of task complexity and to improve tracking performance in the most complex approach task. Author

DEVELOPMENTAL AIRDROP TESTING TECHNIQUES AND DEVICES

H. J. HUNTER and R. K. BOGUE, ed. Sep. 1987 97 p
(AGARD-AG-300-VOL-6; ISBN-92-835-1559-5) Avail: NTIS HC A05/MF A01

The practical aspects of planning, conducting, and reporting on developmental airdrop tests made from cargo transport type aircraft are presented. Typical cargo aircraft aerial delivery systems, parachute extraction systems, and special devices and rigging techniques are described in detail. Typical instrumentation systems for obtaining aircraft and parachute systems force data are also described and piloting techniques for various airdrop methods are briefly discussed. A scenario of a typical parachute tow test is used to demonstrate the application of these techniques and the use of challenge and response checklists among the flight crewmembers. Finally the use of reports is discussed and appendices are included with many useful charts and calculations that are readily applicable in research and development airdrop testing. Author

AN EVALUATION PLAN OF BUS ARCHITECTURES AND PROTOCOLS USING THE NASA AMES INTELLIGENT REDUNDANT ACTUATION SYSTEM

P. DEFEO and M. CHEN Aug. 1987 34 p
(Contract NAS2-12081)
(NASA-CR-177458; NAS 1.26:177458) Avail: NTIS HC A03/MF A01 CSCL 01C

Means for evaluating data bus architectures and protocols for highly integrated flight control system applications are needed. Described are the criteria and plans to do this by using the NASA/Ames Intelligent Redundant Actuation System (IRAS) experimental set-up. Candidate bus architectures differ from one another in terms of: topology, access control, message transfer schemes, message characteristics, initialization, data flow control, transmission rates, fault tolerance, and time synchronization. The evaluation criteria are developed relative to these features. A preliminary, analytical evaluation of four candidate busses (MIL-STD-1553B, DATAC, Ethernet, and HSIS) is described. A bus must be exercised in a real-time environment to evaluate its dynamic characteristics. A plan for real-time evaluation of these four busses using a combination of hardware and simulation techniques is presented. Author

EXPERIMENTAL AEROTHERMODYNAMIC RESEARCH OF HYPERSONIC AIRCRAFT Technical Progress Report, 1 Mar. - 30 Sep. 1987

JOSEPH W. CLEARY 9 Dec. 1987 28 p
(Contract NCC2-416)
(NASA-CR-181533; NAS 1.26:181533) Avail: NTIS HC A03/MF A01 CSCL 01C

The 2-D and 3-D advance computer codes being developed for use in the design of such hypersonic aircraft as the National Aero-Space Plane require comparison of the computational results with a broad spectrum of experimental data to fully assess the validity of the codes. This is particularly true for complex flow fields with control surfaces present and for flows with separation, such as leeside flow. Therefore, the objective is to provide a hypersonic experimental data base required for validation of advanced computational fluid dynamics (CFD) computer codes and for development of more thorough understanding of the flow physics necessary for these codes. This is being done by implementing a comprehensive test program for a generic all-body hypersonic aircraft model in the NASA/Ames 3.5 foot Hypersonic Wind Tunnel over a broad range of test conditions to obtain pertinent surface and flowfield data. Results from the flow visualization portion of the investigation are presented. Author

HOVERING HELICOPTER FLIGHT DYNAMICS: A STUDY OF VERTICAL MOTION

C. R. GUY Feb. 1987 47 p
(AR-004-526; ARL-AERO-TM-386) Avail: NTIS HC A03/MF A01

The flight dynamic characteristics of a hovering helicopter in response to collective stick inputs are examined. A mathematical model of the aerodynamics/kinetics and rotor system dynamics of a representative aircraft, linearized about the hovering flight condition, is used as a basis for the study. The dynamic behavior of this model is compared with flight test results for similar inputs and the coefficients are adjusted to improve model performance. The model structure is then modified by the incorporation of additional terms to improve its accuracy. Although no attempt is made to optimize the coefficients of the model using parameter identification techniques, the approach used here provides acceptable results. Author

OPTIMUM TAKE-OFF RUN OF AIRCRAFT ON GROUND AIRFIELDS Abstract Only

A. A. BADYAGIN *In its* USSR Report: Engineering and Equipment p 2 28 May 1987 Transl. into ENGLISH from *Izvestiya Vysshikh Uchebnykh Zavedeniy: Aviatsonnaya Tekhnika* (Kazan, USSR), no. 4, Oct. - Dec. 1985 p 12-16

Avail: NTIS HC A06/MF A01

Conditions under which the most favorable for take off attack angle is small were clarified. It has been alleged by another author that a drawback of this takeoff method was a rather long takeoff run, especially in the case of poor ground. Here, the opposite result was obtained: the more the resistance coefficient of ground (the poorer the ground), the larger are the optimum attack angle and the aircraft lift coefficient during takeoff. It was explained from the physical standpoint by the fact that aerodynamic wing relief not only makes it possible to realize the well known effect of reducing ground resistance forces, but also to reduce the coefficient of resistance to wheel movement. EFFECT OF PERMISSIBLE VARIATIONS OF CENTER-OF-GRAVITY LOCATIONS OF CARGO AIRPLANE ON ITS MASS Abstract Only

V. P. GOGOLIN *In its* USSR Report: Engineering and Equipment p 4 28 May 1987 Transl. into ENGLISH from *Izvestiya Vysshikh Uchebnykh Zavedeniy: Aviatsonnaya Tekhnika* (Kazan, USSR), no. 4, Oct. - Dec. 1985 p 24-28

Avail: NTIS HC A06/MF A01

In order to meet the requirements for stability and controllability and for the operational range of center of gravity locations, parameters of horizontal tail surfaces that determine the aft and forward limits of center-of-gravity location were chosen. At chosen parameters of the shape of airplane components, the permissible range of variations of operational center-of-gravity locations determined relationships between empennage and wing dimensions. If it is possible to narrow the range of operational center-of-gravity locations by means of design changes that require expenditures of mass (for instance, installing a fuel tank in the tail fin), the problem of determining the maximum permissible value of these expenditures comes up. This problem was solved, based on the concept of coefficients of increase of airplane mass. The derived solution was applied to a hypothetical airplane, similar, as far as its characteristics were concerned, to the TU-134 airplane. Author

SYSTEM FOR SAR MISSIONS [SYSTEME DE MISSION SAR]
S. RIOCHE /in AGARD, Rotorcraft Design for Operations 10 p Jun. 1987 In FRENCH
Avail: NTIS HC A14/MF A01

The helicopter division of Aerospatiale developed a specially adapted system for search and rescue (SAR) missions at sea. The system allows entirely automatic piloting and guidance, particularly during the execution of search patterns and the descent to hovering flight in the proximity of the target. An electronic flight instrument system (EFIS) panel includes cathode screen displays for attitude, horizontal situation parameters, and search radar data. The horizontal situation parameters are selected as a function of the phase of flight from four modes: horizontal situation indicator, sector with or without superimposed radar data, search pattern, and hover. THE AVIONICS FLIGHT EVALUATION SYSTEM (AFES) OF THE DFVLR

KARLHEINZ HURRASS and PETER SCHULZ Jul. 1987 87 p Transl. into ENGLISH of Das Avionik-Flugprobungssystem (AFES) der DFVLR (Brunswick, Federal Republic of Germany) Original language document was previously announced as N85-27864 (ESA-TT-1037; DFVLR-MITT-85-01; ETN-87-91116) Avail: NTIS HC A05/MF A01; original German version available from DFVLR, Cologne, Federal Republic of Germany DM 23

A real time avionics flight evaluation system using a laser radar unit instead of recording theodolites was designed. The inertial navigation system on board the test platform, the tracking radar, and sensors are integrated via a Kalman filter by a computer in the test aircraft. Before the measurement results of the ground sensors are up linked to the aircraft, they are preprocessed in a computer belonging to the radar units. Accuracies of up to 0.1 m for position and up to 0.01 m/sec for velocity are achieved in determining the reference flight path. Determination of the reference data is almost continuous. Multipath propagation disturbance factor is measured by a subsystem. Another subsystem simulates a particular number of users of a navigation system. ESA

EFFECTS OF COMBINING VERTICAL AND HORIZONTAL INFORMATION INTO A PRIMARY FLIGHT DISPLAY

TERENCE S. ABBOTT, MARK NATAUPSKY, and GEORGE G. STEINMETZ Dec. 1987 21 p (NASA-TP-2783; L-16366; NAS 1.60:2783) Avail: NTIS HC A03/MF A01 CSCL 01D

A ground-based aircraft simulation study was conducted to determine the effects of combining vertical and horizontal flight information into a single display. Two display configurations were used in this study. The first configuration consisted of a Primary Flight Display (PFD) format and a Horizontal Situation Display (HSD) with the PFD displayed conventionally above the HSD. For the second display configuration, the HSD format was combined with the PFD format. Four subjects participated in this study. Data were collected on performance parameters, pilot-control inputs, auditory evoked response parameters (AEP), oculometer measurements (eye-scan), and heart rate. Subjective pilot opinion was gathered through questionnaire data and scorings for both the Subjective Workload Assessment Technique (SWAT) and the NASA Task Load Index (NASA-TLX). The results of this study showed that, from a performance and subjective standpoint, the combined configuration was better than the separate configuration. Additionally, both the eye-transition and eye-dwell times for the separate HSD were notably higher than expected, with a 46% increase in available visual time when going from double to single display configuration. HIGH MACH PROPULSION SYSTEM INSTALLATION AND EXHAUST SYSTEM DESIGN CONSIDERATIONS

D. J. DUSA (General Electric Co., Cincinnati, OH) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 6 p. (AIAA PAPER 87-2941)

The prospects that have emerged for the development of efficient powerplants operating in the Mach 3-6 regime, for both commercial transport aircraft and military aircraft, are presently evaluated in view of the last decade's advancements in aircraft gas turbine engine technology. Attention is given to exhaust nozzle component technology readiness issues associated with the use of such exotic fuels as hydrogen and methane, on the one hand, and the generally far higher operating temperatures that will be encountered, on the other. While turbofan cycles are preferred below Mach 4, a dual-mode turboramjet will be needed for the Mach 4-6 regime. O.C.

FAULT DETECTION - DIAGNOSIS AND PREDICTIVE MAINTENANCE

ANDRE RAULT and CHRYSOSTOME BASKIOTIS (ADERSA, Verrieres-le-Buisson, France) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 1593-1597. refs

The general principles of fault detection, diagnosis, and predictive maintenance are presented. The diagnosis methodology is analyzed for two jet-engine applications: the Marbore single-spool engine and the Larzac twin-spool engine. The Larzac example shows that, among the performance analysis parameters, the dynamic ones are better for fault detection. It is also shown that the methodology has to be adaptive and progressive as the learning population cannot be complete; a specific measure of the degree of membership of a newcomer to the incomplete classes has been developed and its efficiency has been demonstrated for the Marbore engine. JUMPING JET POWER FOR THE NEXT CENTURY

CHARLES GILSON Interavia (ISSN 0020-5168), vol. 42, Oct. 1987, p. 1033-1036.

There is as yet no stated requirement for a supersonic dash-capable, advanced STOVL combat aircraft that would serve as a replacement for the current Harrier/Sea Harrier/Harrier II aircraft in U.S. and British inventories; nevertheless, conceptual studies are proceeding which have as their general design reference-point a single-engined air superiority fighter with supersonic capability only to about Mach 1.6. Attention is presently given to propulsion system configurations involving thrust vectoring with plenum chamber burning, remote augmented lift, ejector-augmented lift, and tandem-fan turbofans. Payload/range and maneuverability are required to be comparable to those of the EFA and Rafale fighters. O.C.

HYDROGEN SCRAMJET WITH SIDE WALL INJECTION

R. G. MORGAN, A. PAULL, N. MORRIS, and R. J. STALKER
IN: National Space Engineering Symposium, 2nd, Sydney, Australia,
Mar. 25-27, 1986, Preprints. Volume 2. Barton, Australia/Brookfield,
VT, Institution of Engineers, Australia/Brookfield Publishing Co.,
1986, 10 p refs
(Contract NAGW-674)

Preliminary results are presented from an experimental evaluation of a hydrogen-burning wall-injection scramjet engine, performed in the free-piston shock tunnel at the Australian National University. The advantages of scramjet propulsion for high-Mach-number high-altitude flight are reviewed, and the need for an alternative to injection struts is indicated. Pressure profiles and heat-transfer measurements for constant-area and diverging ducts are presented graphically and characterized in detail. The ability of the injected flow to shield the chamber wall from the heat of the freestream flow is demonstrated. The extrapolation of the shock-tunnel results to flight conditions, however, is made difficult by the fact that a significant amount of fuel passes through a quenched zone without burning, seriously degrading overall performance. COMBINED CYCLE PROPULSION FOR HYPERSONIC FLIGHT

DAVID L. KORS (Aerojet TechSystems Co., Sacramento, CA) IAF,
International Astronautical Congress, 38th, Brighton, England, Oct.
10-17, 1987, 11 p. refs
(IAF PAPER 87-263)

During the two decades from 1965 to 1985, hypersonic airbreathing propulsion underwent only token research, which has nevertheless yielded a very substantial data base for post-1985 efforts toward combined rocket/airbreathing propulsion cycles. Attention is presently given to configurations variously derived from the integration of generic turbojet, ramjet, and rocket technologies, yielding turboramjets, turboramjet-rockets, turborockets, ducted rockets, ejector ramjets, and supercharged ejector ramjets. The advantages of scramjets are discussed in the framework of their aerodynamic configuration integration requirements. O.C.

NEW DEVELOPMENTS OF EUROPEAN POWERPLANTS FOR HELICOPTERS; PROCEEDINGS OF THE SYMPOSIUM, LONDON, ENGLAND, OCT. 21, 1986

London, Royal Aeronautical Society, 1986, 127 p. For individual items see A88-16729 to A88-16734.

This symposium report includes papers on two new power plants for helicopters, the TM 333 and TM 319 turboshafts; the MTM 385 engine; and the RTM 322 turboshaft engine. Other papers presented are on RTM 322 electronic control and anticipated developments, the TM 319 and TM 333 electronic control design and operational features, propulsion aspects of achieving high speed with helicopters, and airworthiness requirements for new engine ratings for helicopters. I.S.

A88-16729

TM 333 AND TM 319 TURBOSHAFTS - TWO NEW POWERPLANTS FOR HELICOPTERS

JOEL SILET (Turbomeca, S.A., Bordes, France) IN: New developments of European powerplants for helicopters; Proceedings of the Symposium, London, England, Oct. 21, 1986. London, Royal Aeronautical Society, 1986, p. 1-14.

The first two engines (TM 333 and TM 319) of a new generation of helicopter powerplants which will cover the 450 to 2400 shp range are described. The design features of the TM 333 and TM 319 are described, and the cross sections are presented. Consideration is also given to the engines' Full Authority Digital Electronic Control system, similar for both engines, and to the installation features. Data on the engine performance, maintenance, and reliability are also given. The salient features of the two new-generation engines include high performance levels, modular and easy maintenance, easy installation, a numerical electronic

fuel control system that operates and optimizes the performance in a large flight envelope, and a large growth potential. I.S.

A88-16730

MTM385 ENGINE

K. TRAPPMANN (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, Federal Republic of Germany) IN: New developments of European powerplants for helicopters; Proceedings of the Symposium, London, England, Oct. 21, 1986. London, Royal Aeronautical Society, 1986, p. 15-38.

The MTM 385 R2, the latest version of the MTM 385 engine designated for the future twin-engine French-German combat helicopter HAP/PAH2/HAC3G is described together with the design and functional characteristics of the engine's components. The engine design requirements include the take-off power of 749 kW (at 1000m and 25 C), 30-s emergency power of 998 kW (at 1500 m), and acceleration of 3 s (0-100 percent power). Tests carried out on the engine's reverse-flow combustion chamber and single-stage transonic compressor turbine, as well as on two demonstrator engines, showed that the majority of the program objectives were attained. I.S.

A88-16731

THE RTM 322 TURBOSHAFT ENGINE

P. V. LANGDELL and O. R. ESPITALIER-NOEL (Rolls-Royce, PLC, Watford, England) IN: New developments of European powerplants for helicopters; Proceedings of the Symposium, London, England, Oct. 21, 1986. London, Royal Aeronautical Society, 1986, p. 39-58.

The RTM 322, a turboshaft engine in the 2000-3000 shp class designated to fill the needs of collaborative European helicopter programs, is described. The high level of performance required by the engine is achieved with a cycle based on a modest pressure ratio, low turbine temperatures, and engine characteristics optimized for part power. A single spool gas generator is used with three-stage axial plus centrifugal compressor, and a compact reverse-flow combustor is used for minimum spool length; a two-stage turbine drives the compressor system. The RTM 322-01 has an overall pressure ratio of 14.7 and a turbine entry temperature of less than 1500 K. The engine has already demonstrated 2400 shp on the test bed. I.S.

A88-16732

RTM322 ELECTRONIC CONTROL AND ANTICIPATED DEVELOPMENTS

D. A. HAIGH and J. TIPTON (Lucas Aerospace, Ltd., Electronic Systems and Equipment Div., Birmingham, England) IN: New developments of European powerplants for helicopters; Proceedings of the Symposium, London, England, Oct. 21, 1986. London, Royal Aeronautical Society, 1986, p. 59-77.

The electronic control unit designed for the RTM 322 turboshaft engine is described. Attention is given to the system architecture, mounting location, programming language, packaging technology, and interface designs, as well as to the thermal considerations, the EMC design principles, and the design features of the main control channel. The salient features of the control unit's flexible modular software system LUCOL are discussed and compared to those of Ada. The design diagrams are included. I.S.

A88-16733

TM 319 AND TM 333 ELECTRONIC CONTROL DESIGN AND OPERATIONAL FEATURES

J. LUC LARRERE (Elecma, Suresnes, France) IN: New developments of European powerplants for helicopters; Proceedings of the Symposium, London, England, Oct. 21, 1986. London, Royal Aeronautical Society, 1986, p. 78-93.

The single-lane full-authority digital electronic control unit designed for the turboshaft engines TM 319 and TM 333 is described. The control unit is a microprocessor-based system made of three subassemblies: a power supply module, a set of stacked racks, and an interconnection module. The control unit controls the free turbine speed through the fuel flow into the gas generator, ensures the free turbine overspeed protection, and controls the

07 AIRCRAFT PROPULSION AND POWER

position of the variable inlet guide vanes. The critical functions are backed up by self-testing analog systems which are surveyed by the main channel. Diagrams depicting the architecture of the control unit are included. I.S.

A88-16734

AIRWORTHINESS REQUIREMENTS FOR NEW ENGINE RATINGS FOR HELICOPTERS

P. D. VINALL (Civil Aviation Authority, Surrey, England) IN: New developments of European powerplants for helicopters; Proceedings of the Symposium, London, England, Oct. 21, 1986. London, Royal Aeronautical Society, 1986, p. 94-119.

he airworthiness requirements for new helicopter-engine ratings are examined. Current helicopter ratings are discussed and compared with new helicopter rating structures, in which the new 30-sec power plus 2-min power in events of engine balking replace the existing maximum contingency. The new Type Endurance testing proposed by AIA and the test requirements proposed by CAA are discussed. In order to bridge the gulf between the two proposals, a modified set of tests is suggested, termed the Flexible Proposal. The testing specifications under the Flexible Proposal are compared to those of the CAA proposal. I.S.

APPLICATION OF A FUZZY CONTROLLER IN FUEL SYSTEM OF TURBOJET ENGINE

QIHUA WU, YUNHUA XU, and BENWEI LI (Northwestern Polytechnical University, Xian, People's Republic of China) Northwestern Polytechnical University, Journal (ISSN 1000-2758), Oct. 1987, p. 23-30. refs

The fundamental principles and practical techniques of fuzzy-control design are discussed, and a fuzzy control for a jet-engine fuel system is developed and tested. The conventional membership-degree calculation method and the phase-plane graphic method of Li (1983) are shown to share the same theoretical basis, and the latter method is found to be more convenient for adjusting simple fuzzy-control rules. The effectiveness of the fuzzy controls developed is demonstrated by means of computer simulations; the results are presented in graphs. T.K.

TEST STAND PERFORMANCE OF A CONVERTIBLE ENGINE FOR ADVANCED V/STOL AND ROTORCRAFT PROPULSION

JACK G. MCARDLE 1987 22 p Presented at the International Powered Lift Conference, Santa Clara, Calif., 7-10 Dec. 1987; sponsored by the Society of Automotive Engineers (NASA-TM-100211; E-3819; NAS 1.15:100211) Avail: NTIS HC A03/MF A01 CSCL 21E

A variable inlet guide vane (VIGV) convertible engine that could be used to power future high-speed V/STOL and rotorcraft was tested on an outdoor stand. The engine ran stably and smoothly in the turbofan, turboshaft, and dual (combined fan and shaft) power modes. In the turbofan mode with the VIGV open, fuel consumption was comparable to that of a conventional turbofan engine. In the turboshaft mode with the VIGV closed, fuel consumption was higher than that of present turboshaft engines because power was wasted in churning fan-tip air flow. In dynamic performance tests with a specially built digital engine control and using a waterbrake dynamometer for shaft load, the engine responded effectively to large steps in thrust command and shaft torque. AIRCRAFT ENGINE EXHAUST PLUME DYNAMICS Final Report, Dec. 1984 - Aug. 1985

B. T. DELANEY, BRYAN A. ZETLEN, RONALD C. TAI, GLENN D. SEITCHEK, and G. G. ELCOCK Oct. 1986 31 p (Contract F08635-85-C-0036) (AD-A184238; AFESC/ESL-TR-86-20) Avail: NTIS HC A03/MF A01 CSCL 21B

This report summarizes a research effort to remedy a known deficiency in the Air Quality Assessment Model dispersion calculation capability. Current methods use dispersion calculations and equations for vertical sources (i.e., power plants) resulting in inaccurate assumptions when applied to the horizontal source of an aircraft engine. This study examined the dispersion of aircraft engine exhaust by using infrared thermal imaging techniques. These results were compared to theoretical equations describing jet exhaust plumes. The resulting validation provided the necessary equations and support to mathematically model this phenomena. GRA

PERFORMANCE AND COMBUSTION CHARACTERISTICS OF DIRECT-INJECTION STRATIFIED-CHARGE ROTARY ENGINES

HUNG LEE NGUYEN Dec. 1987 29 p (NASA-TM-100134; E-3684; NAS 1.15:100134) Avail: NTIS HC A03/MF A01 CSCL 21A

Computer simulations of the direct-injection stratified-charge (DISC) Wankel engine have been used to calculate heat release rates and performance and efficiency characteristics of the 1007R engine. Engine pressure data have been used in a heat release analysis to study the effects of heat transfer, leakage, and crevice flows. Predicted engine performance data are compared with experimental test data over a range of engine speeds and loads. An examination of methods to improve the performance of the Wankel engine with faster combustion, reduced leakage, higher compression ratio, and turbocharging is presented. Author

EXPERIENCE WITH NASA-LANGLEY TECHNOLOGY FOR A FREE-FLYING MODEL IN A WIND TUNNEL [ERFAHRUNGEN MIT DER NASA-LANGLEY-TECHNIK EINES FREIFLIEGENDEN MODELLS IM WINDKANAL]

HELMUT JOHN (Messerschmitt-Boelkow-Blohm GmbH, Ottobrunn, Federal Republic of Germany) IN: Flows with separation; DGLR Specialists' Symposium, 5th, Munich, Federal Republic of Germany, Oct. 9, 10, 1986, Reports. Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1986, p. 99-110. In German.

Experimental results on a new technology for a free-flying model conducted in a subsonic wind tunnel are reported. An ejector driven by a loosely connected supply line is used in the thrust simulation. As well as being flown freely, the model can be steered about three axes using a simplified steering system and three 'ministicks'. The technology permits studies in the separated flow region and in the present case up to an angle of 90 deg. C.D.

FLIGHT CONTROL SYNTHESIS TO MEET FLYING QUALITIES SPECIFICATIONS - AN EVALUATION OF MULTIVARIABLE SYNTHESIS TECHNIQUES

THOMAS R. WENDEL (McDonnell Aircraft Co., Saint Louis, MO) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 11 p. refs

Four different multivariable model-following design techniques were evaluated to assess their applicability to the flight control law design of advanced aerospace vehicles. The ability of these synthesis techniques to meet the flying qualities, robustness, and turbulence rejection requirements of future fighter aircraft within the deflection and rate constraints of the actuation system was examined. The gain scheduling required to implement the control laws developed by these synthesis techniques was also investigated and the manpower required to formulate a control system capable of meeting the chosen design objectives was evaluated. This evaluation identified strengths and weaknesses of the techniques and established effective ways of applying these algorithms to the design of 'real world' high order control systems. It was determined that these algorithms can meet flying qualities requirements of advanced fighter aircraft while satisfying stability margin and turbulence rejection requirements. However, the ability of these algorithms to effectively manage high order dynamics such as actuator dynamics, sensor dynamics and structural filters should be improved. Author

AN ANALYSIS OF A CANDIDATE CONTROL ALGORITHM FOR A RIDE QUALITY AUGMENTATION SYSTEM

REINER SUKAT, KENT DONALDSON, and DAVID R. DOWNING (Kansas, University, Lawrence) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 9 p. refs

(Contract NAG1-345)

(AIAA PAPER 87-2936)

This paper presents a detailed analysis of a candidate algorithm for a ride quality augmentation system. The algorithm consists of a full-state feedback control law based on optimal control output weighting, estimators for angle of attack and sideslip, and a maneuvering algorithm. The control law is shown to perform well by both frequency and time domain analysis. The rms vertical acceleration is reduced by about 40 percent over the whole mission

flight envelope. The estimators for the angle of attack and sideslip avoid the often inaccurate or costly direct measurement of those angles. The maneuvering algorithm will allow the augmented airplane to respond to pilot inputs. The design characteristics and performance are documented by the closed-loop eigenvalues; rms levels of vertical, lateral, and longitudinal acceleration; and representative time histories and frequency response. REDUCED ORDER VARIABLE STRUCTURE CONTROL OF THE LATERAL MOTION OF AN AIRCRAFT

B. A. WHITE (Royal Military College of Science, Shrivenham, England), R. J. PATTON, S. MUDGE, and P. P. ASLIN (York, University, England) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 322-327. refs

This paper looks at the application of Variable Structure Control (VSC) theory to the problem of lateral control of a Machan aircraft. A full state switching VSC system is developed and is shown to produce dynamic responses in roll and yaw which are functions of pitch and roll angle. A reduced state switching VSC system is subsequently defined to produce a more invariant performance. Author

A88-14960

FLIGHT CONTROL OF AN X-29 TYPE AIRCRAFT VIA A COMBINATION OF LQ OPTIMIZATION TECHNIQUES

R. MARIE and E. KREINDLER (Technion - Israel Institute of Technology, Haifa) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 656-660. refs

The longitudinal flight control of a forward-swept-wing, inherently unstable aircraft with significant wing aeroelasticity is considered, using implicit model following to design handling qualities and frequency weighting to damp the aeroelastic modes. The former technique introduces into the performance index the equations of a model embodying the desired closed-loop characteristics; the latter has frequency-dependent weighting parameters in the index, thereby introducing dynamics into the state feedback. For the design problem at hand, the two techniques turned out to be complementary; a combination which exploits the advantages of both was successful. Author

A88-14961

A DECOUPLING APPROACH TO THE DESIGN OF THE TWO-DEGREE-OF-FREEDOM TRACKING CONTROL SYSTEMS
E. SOROKA and U. SHAKED (Tel Aviv University, Israel) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 661-665. refs

A general new decoupling configuration of the two-degree-of-freedom tracking control system is presented. In this configuration the closed loop part, that satisfies the regulation requirements, and the prefilter part, that yields the desired command response, can be found independently one from the other. When implemented, each part of the controller does not interfere with the response characteristics that were shaped by the other part. The developed theory is shown to provide a new general conceptual approach for the design of linear tracking control systems. The theory is applied in a design of nominal and decoupled flight control modes of the Control Augmentation System (CAS) for fighter aircrafts. Author

A88-14965

A NUMERICAL APPROACH FOR ON-LINE GUIDANCE OF AIRCRAFT

WERNER GRIMM (DFVLR, Institut fuer Dynamik der Flugsysteme, Wessling, Federal Republic of Germany) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 683-687. refs

A numerical procedure for flight path optimization in real time is presented. The optimal control problems are solved relative to a reduced version of the state equations, assuming that flight path inclination and heading angle are directly controllable. Two basic concepts make the method fast and robust, and therefore make it feasible for on-line implementation: (1) the replacement of expensive numerical integration by a special integrator for the reduced ODE system; and (2) the adaptation of state constraints in such a way that they can be satisfied by analytical elimination of parameters. The algorithm is tested on two problems: range maximization and minimum-time intercept; and a comparison with open-loop trajectories shows that the proposed feedback control is highly accurate. B.J.

A88-14978

APPLICATION OF ROBUST DIRECT ADAPTIVE CONTROL TO THE LONGITUDINAL DYNAMICS OF A FIGHTER AIRCRAFT

K. M. SOBEL, H. P. LEE (Lockheed-California Co., Burbank), and P. IOANNOU (Southern California, University, Los Angeles, CA) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 844, 845. Research supported by Lockheed-Georgia Co. refs

This paper investigates the use of a robust direct adaptive controller (RDAC) for controlling the linearized time varying dynamics of the longitudinal motion of an F-16 aircraft and compares its performance with that of gain scheduling and fixed controller schemes. Four different control schemes are simulated and their performance is compared for different input commands over a complete flight envelope. The simulation results show that the control schemes which employ the RDAC perform much better than the fixed and gain scheduling control schemes. Author

STUDY OF THE EFFECTS OF DISCRETIZING QUANTITATIVE FEEDBACK THEORY ANALOG CONTROL SYSTEM DESIGNS

J. S. COUCOULES, C. H. HOUPIS (USAF, Institute of Technology, Wright-Patterson AFB, OH), and G. B. LAMONT (Wright State University, Dayton, OH) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 1603-1608. refs

An analysis is made of the feasibility of using the pseudo continuous time (PCT) modeling approach for a sampled-data system in extending continuous domain (analog) quantitative

feedback theory (QFT) flight control system designs to the discrete domain. The results of two analog designs are studied for digital implementation. Simulation results for a transport aircraft show that the Tustin transformation with PCT modeling provides good results using a sampling rate of 40 Hz. In addition, results are obtained with a sampling rate of 60 Hz for a fighter aircraft. It is concluded that the Tustin transformation with PCT modeling provides good discrete system performance in transforming the continuous QFT design for a variety of operational modes. B.J.

THE ON-LINE IDENTIFICATION AND ITS MICROPROCESSOR REALIZATION OF THE EQUIVALENT SYSTEMS OF AIRCRAFT

FENG LIANG and LINCHANG ZHANG (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 8, May 1987, p. A296-A302. In Chinese, with abstract in English.

A new method is proposed in this paper to use a microprocessor system to evaluate the flight qualities of aircraft. The extended Kalman filtering algorithm (EKF) is used to estimate the parameters of the discrete model of longitudinal equivalent systems. Some new improvements are made for EKF algorithm to prevent divergence of estimated parameters and to reduce the estimating errors. The algorithm will converge to a local minimum because of the reduced order approximation. Satisfactory accuracy of parameter estimation and fast convergent rates have been achieved by both digital simulation calculation and microprocessor system experiments using arbitrary input signals. The experimental system works stationarily and has good repeatable characteristics. Author

DEVELOPMENT OF MANEUVER LOADS SPECTRUM FOR X-TYPE AIRCRAFT

SHUNQI HUANG (China Flight Test Research Center, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 8, June 1987, p. B291-B294. In Chinese, with abstract in English.

This paper describes an approach for obtaining a maneuver load spectrum for an X-type aircraft using the flight-by-flight spectrum method. First of all, the mission segment spectra are developed based on the typical mission profiles; then the mission spectra and the maneuver spectrum are derived. The maneuver spectrum is compared with the load spectra of several types of aircraft. Author

MECHANISMS OF ACTIVE CONTROL IN CYLINDRICAL FUSELAGE STRUCTURES

R. J. SILCOX, H. C. LESTER (NASA, Langley Research Center, Hampton, VA), and C. R. FULLER (Virginia Polytechnic Institute and State University, Blacksburg, VA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 11 p. refs (AIAA PAPER 87-2703)

This paper summarizes ongoing efforts to understand and exploit active control techniques for low frequency noise suppression in aerospace applications. Analytical models are utilized in an effort to understand the mechanisms that govern noise transmission into acoustic spaces enclosed by lightweight structures and to examine the results of experimental implementations of active control schemes. Emphasis is placed on attaining global noise reductions using a minimum number of actuators rather than localized control over many subregions. This program has demonstrated the effect of synchrophasing and interface modal filtering, in limiting the modal density within the acoustic space, and how strong reactive effects may occur in two dimensional geometries. Finally, the performance of active control systems utilizing acoustic and vibration actuators is evaluated. Suppressions of 10 to 30 dB are demonstrated in practice, and performance is discussed in relation to the physical mechanisms and parameters of the system. Author

INVESTIGATION OF VERTICAL AXIS HANDLING QUALITIES FOR HELICOPTER HOVER AND NOE FLIGHT
 S. W. BAILLIE and J. M. MORGAN /in AGARD, Rotorcraft Design for Operations 9 p Jun. 1987 Sponsored in part by Canadian Department of National Defense
 Avail: NTIS HC A14/MF A01

The preliminary results of two in-flight simulation programs on vertical axis rotorcraft handling qualities are presented. The parameters investigated in these studies were heave damping, thrust to weight ratio (T/W), and a number of dynamic engine governor/rotor system models. Flight tasks include hover, hover maneuvering and nap of the Earth (NOE) flight. Evaluation of nine heave damping, thrust to weight ratio configurations provides the basis to suggest Level 1 Z sub w and T/W boundary values of -0.20 sec⁻¹ and 1.08 respectively. These boundaries are compared with other relevant work on the topic. The engine governor/rotor system evaluation results tend to disagree with handling qualities predictions based on a vertical velocity shaping parameter. Author

HANDLING QUALITIES CRITERION FOR VERY LOW VISIBILITY ROTORCRAFT
 ROGER H. HOH /in AGARD, Rotorcraft Design for Operations 15 p Jun. 1987
 Avail: NTIS HC A14/MF A01

This research was conducted to investigate the required visual cueing for low speed and hover and to determine if an increase in stabilization can effectively be used to compensate for the loss of essential cues. Two flight test experiments were conducted using a conventional helicopter and a variable stability helicopter, as well as electronically fogged lenses and night vision goggles with daylight training filters. The primary conclusion regarding the essential cues for hover was that fine grained texture is more important than large discrete objects or field of view. The use of attitude command augmentation was found to be effective as a way to make up for display deficiencies. However, a corresponding loss of agility occurred with the tested attitude command/attitude hold system resulting in unfavorable pilot comments. Hence, the favorable control display tradeoff must be interpreted in the context that the best solution would be to improve the vision aid. Such an improvement would require an increase in the visual microtexture, an advancement in display technology that is unlikely to be available in the foreseeable future. Therefore, a criterion was developed to systematically evaluate display quality and the associated upgrade in required stabilization as a function of increasingly degraded visual cues. Author

ACTIVE CONTROL OF HELICOPTER VIBRATION USING MULTILOOP SELF-ADAPTIVE CONTROL [CONTROLE ACTIF DES VIBRATIONS SUR HELICOPTERE PAR COMMANDS MULTICYCLIQUES AUTOADAPTATIVES]
 MARC ACHACHE and MICHEL GAUVRIT (Centre d'Etudes et de Recherches, Toulouse, France) /in AGARD, Rotorcraft Design for Operations 10 p Jun. 1987 In FRENCH
 Avail: NTIS HC A14/MF A01

A research program for the development of a trial multiloop control system for the active control of vibration in the main rotor blades is described. This experimentation consists of the most significant applications of self-adaptive control techniques to stochastic systems. The various stages of the program are discussed, from the research on the theoretical model of helicopter vibratory behavior under the influence of multiloop control, to the system flight tests. CONTROLLING THE DYNAMIC ENVIRONMENT DURING NOE FLIGHT
 DENNIS R. HALWES /in AGARD, Rotorcraft Design for Operations 9 p Jun. 1987
 Avail: NTIS HC A14/MF A01

A six degree-of-freedom isolation system using six Liquid Inertia Vibration Eliminator (LIVE) units was installed on a Bell 206LM helicopter. The system was named the Total Rotor Isolation System (TRIS). To determine the effectiveness of TRIS in reducing helicopter vibrations, a flight verification study was conducted. The objective was to demonstrate a 90 percent (or greater) isolation of the helicopter fuselage from the main rotor forces and moments transmitted at the blade passage frequency, which is 4/rev in the case of the Bell 206LM. The flight test data indicate that the objectives were surpassed. Author

MINIMISATION OF HELICOPTER VIBRATION THROUGH ACTIVE CONTROL OF STRUCTURAL RESPONSE
 S. P. KING and A. E. STAPLE /in AGARD, Rotorcraft Design for Operations 13 p Jun. 1987
 Avail: NTIS HC A14/MF A01

The current demonstration and installation of the Active Control Structural Response (ACSR) technique on a Westland 30 helicopter is discussed. The technique employs high frequency force actuation within the helicopter's structure. These forces are superposed onto the dominant vibratory forces in an active manner, such that the fuselage vibratory response is minimized. The basic control philosophy for ACSR is described and the current experimental demonstration status is detailed. Author

FLIGHT PROPULSION CONTROL INTEGRATION FOR V/STOL AIRCRAFT
 JAMES R. MIHALOEWSKY 1987 22 p Presented at the International Powered Lift Conference, Santa Clara, Calif., 7-10 Dec. 1987; sponsored by the Society of Automotive Engineers (NASA-TM-100226; E-3845; NAS 1.15:100226) Avail: NTIS HC A03/MF A01 CSCL 01C

The goal of the propulsion community is to have the enabling propulsion technologies in place to permit a low risk decision regarding the initiation of a research STOVL supersonic attack fighter aircraft in the mid-1990's. This technology will effectively integrate, enhance, and extend the supersonic cruise, STOVL, and fighter/attack programs to enable U.S. industry to develop a revolutionary supersonic short takeoff vertical landing fighter/attack aircraft in the post-ATF period. The rationale, methods, and criteria used in developing a joint NASA Lewis and NASA Ames research program to develop the technology element for integrated flight propulsion control through integrated methodologies is presented. This program, the Supersonic STOVL Integrated Flight Propulsion Controls Program, is part of the overall NASA Lewis Supersonic STOVL integrated approach to an integrated program to achieve integrated flight propulsion control technology. ENGINE/AIRFRAME RESPONSE EVALUATION OF THE HH-60A HELICOPTER EQUIPPED WITH THE T700-GE-701 TRANSIENT DROOP IMPROVEMENT ELECTRONIC CONTROL UNIT Final Report, 9 Jun. - 25 Aug. 1987
 GARY L. BENDER, JAMES A. ADKINS, and ROY A. LOCKWOOD Oct. 1986 79 p
 (AD-A184443; USAAFEA-86-02) Avail: NTIS HC A05/MF A01 CSCL 01C

The engine/drive train response was stable for all tests performed. The best configuration for magnitude of main rotors speed droop, rotor speed/power turbine speed droop recovery characteristics, and power turbine speed governing characteristics was the HH-60A with the T700-GE-401 engines equipped with the -401 transient droop improvement engine control unit. The

08 AIRCRAFT STABILITY AND CONTROL

HH-60A with the T700-GE-401 engine equipped with the -701 transient droop improvement engine control unit (with and without the collective potentiometer input) exhibited larger rotor speed droop, noticeable drive train oscillation during droop recovery, and less desirable power turbine speed governing characteristics. The undesirable engine/airframe characteristics of the HH-60A with the -701 transient droop improvement engine control unit is a shortcoming. The UH-60A with the T700-GE-700 engine demonstrated the largest main rotor speed droop but residual drive train oscillations were small, droop recovery characteristics were more predictable and power turbine speed governing was noticeably more stable than demonstrated by the T700-GE-401 engines equipped with the -701 transient droop improvement engine control unit. The undesirable engine/airframe response (large main rotor speed droop) of the UH-60A with the T700-GE-700 engines is a previously identified shortcoming. Future designs for the UH-60 engine control units should include all the transient droop improvements of the -401 transient droop improvement engine control unit. Additionally, future designs of engine control units should have dynamics tailored to the particular helicopter in which the engines are to be installed. GRA

SOME DATA PROCESSING REQUIREMENTS FOR PRECISION NAP-OF-THE-EARTH (NOE) GUIDANCE AND CONTROL OF ROTORCRAFT

WARREN F. CLEMENT, DUANE T. MCRUER, and RAYMOND E. MAGDELENO Feb. 1987 224 p
(Contract NAS2-12364)

(NASA-CR-177453; NAS 1.26:177453; TR-1239-1) Avail: NTIS HC A10/MF A01 CSCL 01C

Nap-Of-the-Earth (NOE) flight in a conventional helicopter is extremely taxing for two pilots under visual conditions. Developing a single pilot all-weather NOE capability will require a fully automatic NOE navigation and flight control capability for which innovative guidance and control concepts were examined. Constrained time-optimality provides a validated criterion for automatically controlled NOE maneuvers if the pilot is to have confidence in the automated maneuvering technique. A second focus was to organize the storage and real-time updating of NOE terrain profiles and obstacles in course-oriented coordinates indexed to the mission flight plan. A method is presented for using pre-flight geodetic parameter identification to establish guidance commands for planned flight profiles and alternates. A method is then suggested for interpolating this guidance command information with the aid of forward and side looking sensors within the resolution of the stored data base, enriching the data content with real-time display, guidance, and control purposes. A third focus defined a class of automatic anticipative guidance algorithms and necessary data preview requirements to follow the vertical, lateral, and longitudinal guidance commands dictated by the updated flight profiles and to address the effects of processing delays in digital guidance and control system candidates. The results of this three-fold research effort offer promising alternatives designed to gain pilot acceptance for automatic guidance and control of rotorcraft in NOE operations. Author

DIGITAL-FLIGHT-CONTROL-SYSTEM SOFTWARE WRITTEN IN AUTOMATED-ENGINEERING-DESIGN LANGUAGE: A USER'S GUIDE OF VERIFICATION AND VALIDATION TOOLS

JIM SAITO Jan. 1987 95 p

(NASA-TM-88313; A-86282; NAS 1.15:88313) Avail: NTIS HC A05/MF A01 CSCL 01C

The user guide of verification and validation (V&V) tools for the Automated Engineering Design (AED) language is specifically written to update the information found in several documents pertaining to the automated verification of flight software tools. The intent is to provide, in one document, all the information necessary to adequately prepare a run to use the AED V&V tools. No attempt is made to discuss the FORTRAN V&V tools since they were not updated and are not currently active. Additionally,

the current descriptions of the AED V&V tools are contained and provides information to augment the NASA TM 84276. The AED V&V tools are accessed from the digital flight control systems verification laboratory (DFCSVL) via a PDP-11/60 digital computer. The AED V&V tool interface handlers on the PDP-11/60 generate a Univac run stream which is transmitted to the Univac via a Remote Job Entry (RJE) link. Job execution takes place on the Univac 1100 and the job output is transmitted back to the DFCSVL and stored as a PDP-11/60 printfile. Author

FLAP-LAG EQUATIONS OF MOTION OF RIGID, ARTICULATED ROTOR BLADES WITH THREE HINGE SEQUENCES

ROBERT T. N. CHEN Nov. 1987 59 p

(NASA-TM-100023; A-87338; NAS 1.15:100023) Avail: NTIS HC A04/MF A01 CSCL 01C

A derivation of coupled flap-lag equations of motion for a rigid articulated rotor with hinge springs and viscous dampers is reported. Three different flapping-lag-pitch hinge sequences are considered and the Lagrange method is used to derive the equations. The effects of the complete six degrees-of-freedom aircraft motions are included and all the inertia dynamic terms are retained; no small-angle assumptions are used in the development. Comparisons of the results with those available in the literature are made. Sources of terms missing in previous analyses, especially those of the inertia dynamics, are identified. Author

AIRCRAFT DYNAMIC RESPONSE CALCULATION BASED ON DISCRETE-CONTINUAL MODEL Abstract Only

M. B. VAKHITOV, A. S. SAFONOV, and I. A. KUZNETSOV *In its* USSR Report: Engineering and Equipment p 3 28 May 1987 Transl. into ENGLISH from Izvestiya Vysshikh Uchebnykh Zavedeniy: Aviatcionnaya Tekhnika (Kazan, USSR), no. 4, Oct. - Dec. 1985 p 16-20

Avail: NTIS HC A06/MF A01

A numerical procedure for the determination of stresses and deformations in cantilevered thin-wall aircraft lifting surfaces under a varying in time load is generalized to take into account the motion of the structure in the aircraft systems as a whole. It was assumed that the aircraft was located in a subsonic compressible flow. Equations of its perturbed motion were derived, only taking into account deformations of its lifting surfaces. External non-stationary aerodynamic loads on deformable lifting surfaces and on a non-deformable aircraft body were determined using the discrete vortex method. The set of equations for deriving parameters of dynamic stress-strain state of aircraft lifting surfaces, of displacements of an aircraft as a whole and of a non-stationary dynamic load consisted of three groups of equations describing the dynamic reaction of the aircraft. Initial conditions for solving these equations are presented. Author

LOCAL-OPTIMAL CONTROL IN SYSTEMS WITH DELAY Abstract Only

G. L. DEGTARYOV and S. A. TERYENTYEV *In its* USSR Report: Engineering and Equipment p 7 28 May 1987 Transl. into ENGLISH from Izvestiya Vysshikh Uchebnykh Zavedeniy: Aviatcionnaya Tekhnika (Kazan, USSR), no. 4, Oct. - Dec. 1985 p 39-42

Avail: NTIS HC A06/MF A01

The problem of determining parameters of the control mechanism in aircraft stabilization systems with the delay that develops in measuring and servosystems is one of the most important problems in developing control systems in modern aircraft. Optimum control was sought as a function of current and previous measurements of the state of the system. Results obtained earlier were expanded. Equations for simulating aircraft movement and for optimum control were proposed. An equation of system motion was derived. Based on conditions of local optimality, a set of equations for determination of controller coefficients was derived.

Solving the set makes it possible to derive the optimal parameters.

WIND SHEAR TUNNEL WITH INCLINED WIRE GAUZE

HARUO KIMURA (Kyushu University, Fukuoka, Japan) and HAMID BASSIRI (Kyushu University, Faculty of Engineering, Memoirs (ISSN 0023-6160), vol. 47, June 1987, p. 115-124.

For studying experimentally the aerodynamic characteristics of aircraft in wind shear using a conventional wind tunnel in which the aircraft model is set restrained from linear movement, a method for producing the wind shear condition - the flow field with spatial and temporal gradients - in the tunnel is presented. The spatial wind gradient is obtained by an inclined wire gauze installed upstream in the test section, and the temporal variation, which corresponds to the situation experienced by a moving aircraft, is generated by rotating the gauze or by controlling the tunnel stagnation pressure. This method is applied to a blowdown type wind tunnel and its validity is shown.

INTEGRATION OF MANNED SIMULATION AND FLIGHT TEST IN AN OPERATIONAL TEST AND EVALUATION PROGRAM

MARK J. WILLIAMS and MARK A. HARTFORD (McDonnell Aircraft Co., Saint Louis, MO) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 8 p.
(AIAA PAPER 87-2924)

A basic outline is presented for integration of a manned simulation test program with a flight test program to accomplish the operational testing and evaluation of a fighter aircraft or a specific fighter weapon subsystem. The intrinsic advantages and disadvantages of operational flight testing and manned simulation are explained. A manned aerial combat simulator is briefly described, along with the benefits of using a simulation to support an operational test. A method of integrating flight test and manned simulation to compensate for their inherent limitations is also presented. This integration provides for a better overall test program than would be possible using either method alone. Issues addressed included the use of a manned simulator for training test participants and as a method of significantly expanding the analytical data base. A sample test matrix and scenario are presented. Analytical issues addressed include possible measures-of-effectiveness to be collected and analyzed during both simulation and flight test.

SUPPORT SYSTEMS FOR NEW LIGHTER-THAN-AIR VEHICLES

ROY P. GIBBENS IN: Airship design and operation - Present and future; Proceedings of the International Conference, London, England, Nov. 18, 19, 1986. Volume 2. London, Royal Aeronautical Society, 1986, p. 18.1 to 18.11.

In order to be cost-effective, ground support equipment such as mooring facilities must be designed along with the airships in question, rather than as an afterthought. Significant savings accrue to the incorporation of in-flight maintenance practices in which servicing equipment and maintenance personnel are carried onboard; their cost is projected to be offset by the achievement of higher levels of reliability. Mooring procedures should be mechanized, and it is recommended that large airships be docked

in fully stationary, rather than weathervaning, circumstances.

THE EFFECTS OF SUCTION AT SIDEWALL AROUND THE MODEL IN A TRANSONIC AIRFOIL WIND TUNNEL

CHAO GAO and SHIJUN LUO (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 8, May 1987, p. A274-A278. In Chinese, with abstract in English. refs

Measured and calculated results on sidewall boundary layers from dry runs in a 300 mm transonic wind tunnel having suction at its solid sidewalls are discussed. The axial Mach number distribution in the dry runs and the effects of sidewall suction on the chordwise and spanwise pressure distributions on a pressure testing model are analyzed. It is found that suction on the sidewall around the model can change the uniformity of the flow field in the dry runs. Suction on the sidewall around the model makes the spanwise pressure distribution uniform but changes the chordwise pressure distribution in the central section.

INTERNATIONAL CONFERENCE ON SIMULATORS, 2ND, UNIVERSITY OF WARWICK, COVENTRY, ENGLAND, SEPT. 7-11, 1986, PROCEEDINGS

Conference organized by IEE. London, Institution of Electrical Engineers (Conference Publication, No. 267), 1986, 239 p. For individual items see A88-16677 to A88-16689.

The conference presents papers on the building of quality software for a command systems simulator, digital propagation simulators, the use of speech technology in air traffic control simulators, flight simulator visual systems, and the computer aided design of surface surveillance radar. Other topics include a simulator for optically sighted, light antiarmor weapons training, cockpit procedure trainers for military aircraft, a real-time power system simulator for hydroturbine plant tests, and the future of flight simulation. Consideration is also given to a low cost flight simulator for twin-engined general aircraft, the FAA advanced simulation plan approval process, and a multiprocessor approach to computer image generation.

A88-16681

A PRACTICAL HELICOPTER CABIN NOISE SIMULATOR

J. A. CHILLERY and J. B. COLLISTER (Royal Aircraft Establishment, Farnborough, England) IN: International Conference on Simulators, 2nd, Coventry, England, Sept. 7-11, 1986, Proceedings. London, Institution of Electrical Engineers, 1986, p. 31-37. refs

A facility has been constructed to simulate the noise fields in helicopter cabins. Helicopter noise reproduction methods are studied with consideration given to signal sources and conditioning, magnetic tape replay, synthetic sources, signal transduction, and output from disk store. The main processor used by the system is a 16-bit minicomputer with normal mass storage and I/O facilities. Output stability was measured as a function of time and variations over an 8-hr day for half power output were found to be less than + or - 1 dB. Applications in Sea King helicopters are described. K.K.

A88-16683

COCKPIT PROCEDURE TRAINERS FOR MILITARY AIRCRAFT

M. COGRAVE and J. W. LYONS (British Aerospace, PLC, London, England) IN: International Conference on Simulators, 2nd, Coventry, England, Sept. 7-11, 1986, Proceedings. London, Institution of Electrical Engineers, 1986, p. 53-58.

The Hawk Mk.60 series cockpit procedure trainer (CPT), which provides levels of simulation adequate to support the training of pilots and ground crew in on-ground cockpit procedures, is described. Certain in-flight procedures such as engine relight, radio and navaid operation, and weapon release are also simulated. CPT standard and enhanced configurations are described; the standard configuration simulates many of the aircraft systems concerned with ground crew and pilot training for engine prestart checks, up to and including the starting and running of the engine. The enhanced configuration makes use of a high level of interactive computer control and monitoring for the instructor. A CPT is also being developed for the Pilatus PC-9 turboprop trainer. K.K.

A88-16686

A LOW COST FLIGHT SIMULATOR FOR TWIN-ENGINE GENERAL AIRCRAFT

D. MCLEAN (Southampton, University, England) and D. A. SETFORD (Scientific Computers, Ltd., Burgess Hill, England) IN: International Conference on Simulators, 2nd, Coventry, England, Sept. 7-11, 1986, Proceedings. London, Institution of Electrical Engineers, 1986, p. 150-154. Research supported by the Loughborough University of Technology, Scientific Computers, Ltd., and SERC.

The need for a low-cost three-axis moving-base flight simulator which would faithfully provide the motion cues appropriate to twin-engined general aviation aircraft is demonstrated. The pitch, roll, and heave axes were chosen, and the aircraft dynamics over the entire flight envelope were simulated using analog circuits. A microprocessor was used to simulate the navigation and communication aids in the selected flight regions. It is noted that safety requirements were built-in so that sudden collapse of the motion base can be prevented. K.K.

A88-16688

THE FAA ADVANCED SIMULATION PLAN APPROVAL PROCESS

J. HUTCHINSON (Singer Link-Miles, Ltd., Lancing, England) IN: International Conference on Simulators, 2nd, Coventry, England, Sept. 7-11, 1986, Proceedings. London, Institution of Electrical Engineers, 1986, p. 176-181.

Some aspects of the certification of civil transport aircraft simulators by the FAA under the Advanced Simulation Plan are discussed. The data requirements, tests, tolerances, and simulation improvements necessary to achieve the three levels of approval given in the FAA Advisory Circular AC120-40 are described. Microprocessor digital control loading technology is currently used to simulate the aircraft control system instead of analog circuitry, and automatic testing has been expanded to check hardware and software. Information for users of a vertical test section blowdown wind tunnel with test section diameters from 150 to 340 mm is presented. The axisymmetric free jet has a Mach number range from 0.5 to 0.95 at subsonic speeds, and from 1.57 to 3.23 at supersonic speeds, with Reynolds numbers, based on a reference length of 1 m, between 3 million and 300 million. Typical testing times are between 30 and 60 sec. ESA

THE ABILITY OF MODIFIED PAVEMENT QUALITY CONCRETE TO RESIST GROUND EROSION CAUSED BY VTOL AIRCRAFT
 A. P. WINSTANLEY Apr. 1987 25 p Original contains color illustrations

(BAE-ARG-238; ETN-87-90936) Avail: Issuing Activity

A fiber reinforced pavement quality concrete (FR PQC) was compared with the normal mix (N PQC) for VTOL aircraft use. The FR PQC lasts slightly longer before the onset of erosion. The FR PQC achieves a slightly higher surface temperature before erosion ensues. The area of erosion after a 40 sec run is less for the FR PQC. The exposed stainless steel fiber area revealed under a FR PQC spall is undesirable with respect to personnel and aircraft tires. Although the FR PQC performs slightly better than the N PQC, this cannot be totally conclusive from such a small sample study. It is possible that the slight gain in performance of the FR PQC sample is due to the reduction of aggregate size, rather than the inclusion of fibers. ESA

THEORETICAL AND EXPERIMENTAL STUDY OF FLOW-CONTROL DEVICES FOR INLETS OF INDRAFT WIND TUNNELS
 Ph.D. Thesis

JAMES CARL ROSS 1987 131 p
 Avail: Univ. Microfilms Order No. DA8716812

Low-contraction ratio wind tunnel inlets have been shown to generate nonuniform velocity fields in the location where it is necessary to place anti-turbulence screens. The pressure drop experienced by the flow passing through the screens is proportional to the local dynamic pressure and can, therefore, result in a nonuniform test-section velocity distribution. The interaction of screens and two-dimensional inlet flow was examined both theoretically and experimentally. The results indicate that the addition of more screens does not improve the test-section velocity distribution except for a very limited range of inlet geometries. In addition, the turning of the flow by the screens was found to be the most important factor influencing the inlet flow distribution and that the turning action of the screens must be included in any analysis of this type of flow. The use of a set of tuning vanes (cascade) upstream of the screens was found to be effective in modifying the inlet flow distribution so as to generate a uniform test-section velocity distribution. A successful application of the inlet cascade to the 80- by 120-Foot Wind Tunnel at NASA Ames Research Center is also presented. Dissert. Abstr.

AN AERODYNAMIC PERFORMANCE EVALUATION OF THE NASA/AMES RESEARCH CENTER ADVANCED CONCEPTS FLIGHT SIMULATOR M.S. Thesis

PAUL F. DONOHUE Jun. 1987 113 p Prepared in cooperation with NPS, Monterey, Calif.

(NASA-TM-89659; NAS 1.15:89659; AD-A184700) Avail: NTIS HC A06/MF A01 CSCL 14B

The results of an aerodynamic performance evaluation of the National Aeronautics and Space Administration (NASA)/Ames Research Center Advanced Concepts Flight Simulator (ACFS), conducted in association with the Navy-NASA Joint Institute of Aeronautics, are presented. The ACFS is a full-mission flight simulator which provides an excellent platform for the critical evaluation of emerging flight systems and aircrew performance. The propulsion and flight dynamics models were evaluated using classical flight test techniques. The aerodynamic performance model of the ACFS was found to realistically represent that of current day, medium range transport aircraft. Recommendations are provided to enhance the capabilities of the ACFS to a level forecast for 1995 transport aircraft. The graphical and tabular results of this study will establish a performance section of the ACFS Operation's Manual. GRA

ANALYSIS OF 7- X 10-FOOT HIGH SPEED WIND TUNNEL SHAFT LOADS IN SUPPORT OF FAN BLADE FAILURE INVESTIGATION

RICHARD W. FAISON Nov. 1987 49 p

(NASA-TM-100504; NAS 1.15:100504) Avail: NTIS HC A03/MF A01 CSCL 14B

This is a report of the investigation of the High-Speed 7- X 10-Foot Wind Tunnel at NASA Langley Research Center, which experienced a catastrophic failure of all 18 Sitka spruce fan blades during operation at 0.8 Mach number on 2 July 1985. The High-Speed Tunnel, a closed-circuit/single-return atmospheric wind tunnel, had been operated since 1945 to support a wide range of subsonic aerodynamic tests and studies. The failed blade set had been in use since 1975. In addition to blade loss, the most significant damage was a bent main drive shaft for a total estimated damage loss of 1.7 million dollars. An analysis of the natural frequency characteristics as well as loads, reactions, stresses, and deflections of the fan drive system resulting from steady-state and dynamic loads due to unbalance was performed. Transient load cases were simulated by step input and ramp input loading functions intended to simulate the loss of one to nine blades (maximum unbalance forces). Author

AN INEXPENSIVE REAL-TIME INTERACTIVE THREE-DIMENSIONAL FLIGHT SIMULATION SYSTEM Summary Report, 1 Aug. 1986 - 31 Jul. 1987

MICHAEL J. ZYDA, ROBERT B. MCGHEE, DOUGLAS B. SMITH, and DALE G. STREYLE 3 Aug. 1987 232 p

(AD-A184340; NPS52-87-034) Avail: NTIS HC A11/MF A01 CSCL 05I

A prototype flight simulator for the Fiber-Optically Guided Missile (FOG-M) is presented. This prototype demonstrates the practicability and feasibility of using low-cost graphics hardware to produce acceptable simulation of flight over terrain generated from Defense Mapping Agency (DMA) digital elevation data. The flight simulator displays a dynamic, three-dimensional, out-the-window view of the terrain in real-time while responding to operator control inputs. The total system cost (software and hardware) of the simulator is an order of magnitude less than most flight simulation systems in current use. GRA

OPEN-GRADED BASES FOR AIRFIELD PAVEMENTS Final Report

WALTER R. BARKER Jul. 1987 76 p
(AD-A184461; WES/MP/GL-87-16) Avail: NTIS HC A05/MF A01 CSCL 13B

Water has long been recognized as a major contributor to pavement failures. To lessen the potential for damage due to water, the US Army Corps of Engineers established drainage criteria for bases and subbases in airfield pavements. Since the establishment of the drainage criteria, the use of dense-graded aggregate has become the most used material type for airfield pavement bases. Laboratory studies conducted in the late 1960's indicated that the dense-graded bases were almost impermeable and would not meet the drainage criteria. Bases constructed from a uniform size aggregate (an open-graded base) would provide the required permeability but do not have the stability of a denser graded base. A literature review and field survey on the use of open-graded bases and the results of a pilot test section to illustrate the structural capabilities of open-graded bases and follow-up on some ongoing studies are included in this report. AI APPLICATIONS TO THE COMMAND AND CONTROL OF FUTURE AEROSPACEPLANE VEHICLES

R. C. PARKINSON (British Aerospace, PLC, Space and Communications Div., Stevenage, England) IAF, International Astronautical Congress, 38th, Brighton, England, Oct. 10-17, 1987. 6 p. refs
(IAF PAPER 87-223)

Future low-cost aerospace-plane launch vehicles will place a premium on minimizing operations costs. At the same time such vehicles may be required to carry out most flights as unmanned, automatic systems. As a consequence, there will be a high reliance on automatic control systems and data interpretation. The need for successful vehicle recovery even when the launch itself is aborted extends these requirements into the safety-critical area of flight control. AI techniques appear to be the key to achieving cost-effective automatic recoverable launch systems, but the applications will have to be carefully evaluated against the techniques available. Key features required for such systems will be transparency to a human operator remote from the vehicle itself (but having to make rapid and effective decisions throughout the vehicle operational cycle) and educability (to extend the system as operational experience accrues). FIBER FORM/PRESSURE MOLDING PROCESSING FOR AIRCRAFT FUSELAGE SUBSTRUCTURE

GARY VAN SCHOONEVELD (XERKON, Inc., Minneapolis, MN) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 123-133.

As the application of composite materials continues to expand into aircraft primary structures, new manufacturing technologies are required to ensure repeatability and cost effectiveness of the structures. Fuselage frames represent a major challenge due to their complex curvature and variable cross-section. The fiber form/Autocomp pressure molding manufacturing approach has been demonstrated on a number of fuselage frame sections. Savings up to 70 percent have been projected for this manufacturing approach, as compared to conventional hand layup/autoclave processing. The reinforcing fiber is knitted into unidirectional and multiple ply fabrics without bending the reinforcing fiber and assembled via stitching to the final configuration of the molded part. The dry fiber form is impregnated by means of a resin infusion process. Final curing of the frame is achieved with the patented Autocomp pressure molding process. The process utilizes integrally heated, matched surface tooling in conjunction with vacuum and pressure. Precise computer control of the process provides high manufacturing throughput and part-to-part consistency. Author

FIELD REPAIR COMPOUNDS FOR THERMOSET AND THERMOPLASTIC COMPOSITES

EDWIN C. CLARK and KENNETH D. CRESSY (Furane Products Co., Los Angeles, CA) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 271-278. refs

There is currently a push by the aerospace industry to utilize more thermoset and thermoplastic materials in the construction of aircraft. This has created new demands for repair of these vehicles in the field. Restrictions imposed on repair materials in the field environment were used to evaluate current repair techniques. This evaluation uncovered the need for materials that perform at higher temperatures and have the ability to bond contaminated surfaces. These deficiencies were most pronounced in the repair of composite laminates and adhesive bonded structures. Syntactic materials currently being used to repair damaged honeycomb were found to meet repair requirements. There is also a lack of data on the use of field repair materials on the new generation thermoplastics. It is in the area of high temperature performance, surface insensitivity, and thermoplastic repair that future developmental work must be focused. Author

A88-13168

A COMPUTER AIDED AIRCRAFT STRUCTURAL COMPOSITE REPAIR SYSTEM

FORREST SANDOW (UASF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 551-557.

PCs can solve many of the design problems that emerge in repair procedures for military aircraft applications of advanced composite materials. Attention is presently given to a CAD system for the analysis of damage, the design of repair measures, and the formulation of repair procedures. Interactive computer programs are under development for the determination of stresses, strains, and strengths around a damage area, using complex potentials, the quadratic failure criterion, and point-stress fracture theory. The moisture content of damaged structures is also noted by these methods. O.C.

A88-13177

COMPOSITE DRIVE SHAFTING APPLICATIONS

BRIAN E. SPENCER (Brunswick Corp., Lincoln, NE) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 650-661. refs

Advancements in composite design and processing techniques have led to the increased production of composite driveshafts for automobile and helicopter drivetrain applications, as costs have been reduced by more refined methods and impact resistance levels have been increased by the development of superior resins. Attention is presently given to: (1) high torque, thick-wall shafts manufactured by a laminate composite cylinder filament-winding process that yields a mere 1-percent void content, (2) the 'no cut fiber' coupling concept for the transmission of torque to and from composite shafts, and (3) an analytical model that predicts the residual stresses in such filament-wound cylinders. O.C.

DEVELOPMENT OF PARTICULATE REINFORCED HIGH STRENGTH ALUMINIUM ALLOY FOR AEROSPACE APPLICATIONS

C. G. KRISHNADAS NAIR, D. DUTTA (Hindustan Aeronautics, Ltd., Bangalore, India), and M. R. KRISHNADEV (Universite Laval, Quebec, Canada) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 889-901.

A SiC particulate-reinforced, high strength Zr-refined Al-Zn-Mg-Cu alloy has been produced by PM. Powder prepared by gas atomization is mixed with SiC particulates in vacuum, followed by hot pressing and extrusion. Microstructure and properties of the composite are discussed. The resulting alloy is forgeable and heat-treatable to develop high strength. The alloy is economical to produce and is considerably cheaper than the Al-Li alloys. Author

AUTOMATED FABRICATION OF GRAPHITE-EPOXY COMPOSITES

WALTER J. KAU, MICHAEL W. MATSON, and JONATHAN P. RUSSELL (Boeing Military Airplane Co., Seattle, WA) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 1152-1155.

A proprietary system for the automated fabrication of graphite-epoxy composite primary aircraft structures is presented which encompasses direct numerical control of prepreg layup procedures and quality control process-monitoring. Experience with the system thus far has indicated that automation is best applied

to large structures, difficult layouts, and parts made from standard cross-sections. The elements of the automated system encompass flat and contour shape laminators, a channel stiffener manufacturing system, a pultruder, a computer-controlled autoclave, and a five-axis router. O.C.

A88-13225

AN OVERVIEW OF FIRE BLOCKING FABRICS

NEIL SAVILLE (Universal Carbon Fibres, Ltd., Gomersal Mills, England) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 1347-1359.

The roles played by fibers, fabric and foam properties, seam problems, and passenger comfort considerations in the manufacture of fire-blocking airliner seats are discussed in view of FAR 25 853 (C) appendix F. Attention is given to test method repeatability, and the ability of Panox/Kevlar/aramid fiber fabrics to interact during burning in such a way as to maximize blockage against fire. Typical aramid fibers are Nomex and Conex; their contraction by 30 percent during burning can be used as a way of closing fiber pores to resist burn-through. O.C.

A88-13235

COMPOSITE STRUCTURES IN HOMEBUILT SPORT AIRCRAFT

ANDREW C. MARSHALL (Orcon Corp., Union City, CA) IN: Advanced materials technology '87; Proceedings of the Thirty-second International SAMPE Symposium and Exhibition, Anaheim, CA, Apr. 6-9, 1987. Covina, CA, Society for the Advancement of Material and Process Engineering, 1987, p. 1510-1518.

The use of composite materials in aircraft built in home workshops has resulted in a major improvement in appearance, styling, and performance. This paper examines some of the reasons behind this shift in the small-aircraft industry. A brief summary of construction materials, performance, and appearance of a few of these modern homebuilt aircraft are presented. Author

STRESS CORROSION CRACKING OF 4340 STEEL IN AIRCRAFT IGNITION STARTER RESIDUES

KEVIN J. KENNELLEY and RAYMOND D. DANIELS (Oklahoma, University, Norman) IN: Corrosion cracking. Metals Park, OH, ASM International, 1986, p. 199-204. refs (Contract F34601-83-C-3448)

Military aircraft use a cartridge ignition system for emergency engine starts. Premature failures of steel (AISI 4340) breech chambers in which the solid propellant cartridges are burned is a serious concern. Analysis of a number of breech chamber failures identified corrosion as one problem with an indication that stress corrosion cracking may also be occurring. A study was made for stress corrosion cracking susceptibility of 4340 steel in a paste made of the residues collected from used breech chambers. The constant extension rate test (CERT) technique was employed and

11 CHEMISTRY AND MATERIALS

SCC susceptibility was demonstrated. The residues, which contain both combustion products from the cartridges and corrosion products from the chamber, were analyzed using elemental analysis and X-ray diffraction techniques. Electrochemical polarization techniques were also utilized to estimate corrosion rates. Author

FAILURE ANALYSIS OF COMPOSITE STRUCTURE MATERIALS Final Report, 1 Oct. 1985 - 31 Aug. 1986

BRIAN SMITH and RAY GROVE 27 May 1987 191 p (Contract F33615-84-C-5010) (AD-A184468; AFWAL-TR-87-4001) Avail: NTIS HC A09/MF A01 CSDL 11D

The objectives of the Failure Analysis for Composite Structural Materials program are to develop analytical and diagnostic techniques that can be used for determining the causes of failure in composite materials and to incorporate these results into a compendium of procedures that may be used as a reference manual when conducting a postfailure analysis of a composite structure, given the failed part as the starting point of the investigation. Such techniques include flowcharts describing the logical arrangement of investigative operations along with diagnostic procedures that reveal the cause and mechanism of failure. To achieve these objectives, this program was divided into five tasks: (1) task 1-literature search and diagnostic technique selection, (2) task 2-specimen production and test, (3) task 3-diagnostic technique evaluations, (4) task 4-creation of a failure analysis compendium, and (5) task 5-evaluation and demonstration of techniques. This final report summarizes the progress and findings of activities carried out for tasks 1 through 5 that identified, organized, and examined a variety of postfailure analysis methods for composite materials. Because such failures may arise from a wide variety of causes, analysis techniques examined included four basic disciplines: nondestructive evaluation (NDE), stress analysis, fractography, and materials characterization. PARACHUTE MATERIALS

C. W. PETERSON and D. W. JOHNSON Jun. 1987 72 p Presented at the Parachute Systems Technology: Fundamentals, Concepts, and Applications, Munich, Fed. Republic of Germany, 22 Jun. 1987 (Contract DE-AC04-76DP-00789) (DE87-014845; SAND-87-1396C; CONF-8706165-4) Avail: NTIS HC A04/MF A01

The purpose of this paper is to present guidelines for the use of Kevlar and nylon materials in modern parachute systems. Nylon has been used in parachutes for many years, so this discussion will place emphasis upon Kevlar material properties and their application to parachute design and construction. Kevlar-29 is an

aramid fiber manufactured by DuPont and is being used on parachute systems requiring high strength-to-weight ratios or sustained strength at high temperatures. Tests of parachutes using Kevlar webbing, braided cords, ribbons, and thread have demonstrated that these Kevlar materials can be used successfully in ribbon parachutes with no detrimental effects on performance. A few changes must be made in the design of a ribbon parachute to accommodate Kevlar's high modulus. Examples of parachutes that use Kevlar suspension lines, radials, ribbons, reefing lines, bridles, and skirt bands are presented to show that they are much lighter and more resistant to aerodynamic heating than all-nylon parachutes. Nylon continues to be an important material for high-performance parachute systems, however. New nylon weaves have resulted in lighter weight, stronger ribbon materials with excellent sewability characteristics. DOE

POTENTIAL HYDRODYNAMIC EFFECTS ON STRUCTURES BY THE BOUNDARY ELEMENT METHOD

D. OUAZAR and N. BENMANSOUR (Mohammadia School of Engineers, Rabat, Morocco) IN: Betech 86; Proceedings of the Second Boundary Element Technology Conference, Cambridge, MA, June 17-19, 1986. Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, p. 331-345. refs

Problems based on a potential or streamfunction formulation of the BEM for the studying of hydrodynamic forces are addressed, with particular attention given to fluid applications of the constant conventional BEM (CBEM) and the regular BEM (RBEM). Comparison of the two methods for three numerical examples (the flow past a circular obstacle in an infinite medium, the flow past a circular obstacle in a channel, and the flow past a symmetric NACA 0018 airfoil) demonstrates the superiority of the RBEM over the CBEM in both accuracy and computational cost. It is noted that the optimal location of the singular points outside the domain remains unsolved on a rational basis. R.R.

A88-13281

SHAPE OPTIMIZATION UTILIZING A BOUNDARY ELEMENT FORMULATION

J. H. KANE (Computer Aided Engineering Associates, Inc., Woodbury, CT) IN: Betech 86; Proceedings of the Second Boundary Element Technology Conference, Cambridge, MA, June 17-19, 1986. Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, p. 781-803. refs

An analytical formulation of numerical techniques for shape optimization is discussed, demonstrating the competitiveness of the boundary element formulation with respect to the finite element formulation for shape optimization of elastic solid objects. Computer programming aspects including geometry, analysis, sensitivity analysis, numerical optimization, and computer graphics are described. Implicit differentiation of the discretized boundary integral equations is shown to be an accurate and computationally efficient method for design sensitivity analysis. Quadratic, nonconforming, isoparametric boundary elements are employed, yielding multizone analysis capability. R.R.

STABILIZATION OF PRECESSION-FREE ROTORS SUPPORTED BY MAGNETS

SHOSUKE SASAKI (Osaka University, Toyonaka, Japan) Journal of Applied Physics (ISSN 0021-8979), vol. 62, Oct. 1, 1987, p. 2610-2615. refs

Two types of precession-free magnetic-suspension rotors are proposed, and the equations of motion for these rotors are presented and solved. The equipment of the type I rotor consists of an induction motor, two sets of suspension magnets, a servomechanism to keep the vertical position of the rotor, and a magnetic precession damper. In the type II rotor, a mechanical device is employed instead of the servomechanism and the magnetic precession damper of the type I rotor. The solutions for the rotating motion of both rotors show that these rotors have very stable rotation. In a preliminary experiment with the type II rotor, a stable rotation of 120,000 rpm was achieved. A higher-speed rotation can be reached easily in the type I equipment because the rotor can be made so as to have a very high resonance frequency for its bending vibration. I.S.

FLOWS WITH SEPARATION; DGLR SPECIALISTS' SYMPOSIUM, 5TH, MUNICH, FEDERAL REPUBLIC OF GERMANY, OCT. 9, 10, 1986, REPORTS [STROEMUNGEN MIT ABLOESUNG; DGLR-FACH-SYMPOSIUM, 5TH, MUNICH, FEDERAL REPUBLIC OF GERMANY, OCT. 9, 10, 1986, BERICHTE]

Symposium sponsored by DGLR and BMFT, Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1986, 443 p. In German and English. For individual items see A88-13427 to A88-13442. (Contract BMFT-LFF-860279) (DGLR-BERICHT 86-03)

Various papers on flow with separation are presented. Individual topics addressed include: inverse boundary layer method for separated flows; experimental investigations of the structure and 'bursting' of eddies at a slender aircraft wing; experience using the NASA-Langley technique of a free-flying model in a wind tunnel; experimental investigations of shock-boundary layer interference with passive influence, of double delta wings with asymmetric flows, and of duck configurations; force and pressure distribution measurements on a supported 65 delta wing for subsonic and transonic Mach numbers. Also discussed are: flow studies on a 65 delta wing with $MA = 0.85$; calculations of nonlinear aerodynamic characteristics of interfering airfoils using an eddy cascade method with subsonic flow; stability analysis as an aid to developing laminar profiles; instability of local separation regions against longitudinal eddies; calculation of cascade flows with local separation regions; pressure-wave boundary layer interaction; influencing wake flows. C.D.

EDDY GENERATION IN HEAT CONDUCTORS [WIRBELGENERATOREN IN WAERMEUEBERTRAGERN]

U. BROCKMEIER, N. K. MITRA, and M. FIEBIG (Bochum, Ruhr-Universitaet, Federal Republic of Germany) IN: Flows with separation; DGLR Specialists' Symposium, 5th, Munich, Federal Republic of Germany, Oct. 9, 10, 1986, Reports. Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1986, p. 3-33. In German. refs

The flow structure, pressure, and temperature distribution of turbulators on the segment surfaces of segmental heat exchangers are investigated. The flow is solved numerically using the fully three-dimensional, incompressible Navier-Stokes equations. The numeric is based on a semiimplicit procedure with multigrid technique. Calculations are performed for a test configuration consisting of two segments and a delta wing as turbulator. The delta wing front edge eddies are studied, including their effect on heat conduction. C.D.

PRESSURE WAVE-BOUNDARY LAYER INTERACTION [DRUCKWELLEN-GRENZSCHICHT WECHSELWIRKUNG]

H. REISTER and H. OERTEL (DFVLR, Institut fuer theoretische Stromungsmechanik, Goettingen, Federal Republic of Germany) IN: Flows with separation; DGLR Specialists' Symposium, 5th, Munich, Federal Republic of Germany, Oct. 9, 10, 1986, Reports. Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1986, p. 409-414. In German. refs

The interaction with laminar and turbulent plate boundary layers of pressure waves arising toward the rear edges in flow around flat plates, airfoil wing profiles, and turbine cascade profile layers is numerically simulated. A Runge-Kutta finite volume method is used to solve the compressible Navier-Stokes equations. The results show that the waves build up to a sawtooth density shock and are simultaneously damped. In the laminar boundary layer, unsteady regions of back flow build up from a critical pressure amplitude; in the turbulent case, no unsteady separation occurs for realistic amplitudes. C.D.

DEVELOPMENT OF FLUID MECHANICS AT THE SIBERIAN BRANCH OF THE ACADEMY OF SCIENCES OF THE USSR [RAZVITIE GIDROMEKHANIKI V SIBIRSKOM OTDELENI AN SSSR]

B. A. LUGOVTSOV and L. V. OVSIANNIKOV PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), July-Aug. 1987, p. 3-22. In Russian. refs

Results of research in the field of fluid mechanics conducted at the Siberian Branch of the Academy of Sciences of the USSR since its establishment are reviewed. In particular, attention is given to developments in the group analysis of differential fluid mechanics equations, free-boundary motions, approximations in wave theory, linear waves, free-boundary flows of viscous fluids, and inertial motion of a finite mass of fluid. The discussion also covers results obtained in shock wave interactions, filtering flows, stationary potential vortex flows, vortex rings, hydrodynamic stability, turbulence, and aeroelasticity. V.L.

FREE VIBRATION CHARACTERISTICS OF DAMPED SANDWICH PANEL STIFFENED WITH DAMPED STRINGERS

B. V. R. GUPTA (Andhra University, Waltair, India), S. NARAYANAN, and N. GANESAN (Indian Institute of Technology, Madras, India) Journal of Sound and Vibration (ISSN 0022-460X), vol. 117, Sept. 8, 1987, p. 393-398. refs

The free vibration of a damped sandwich panel reinforced with damped top-hat stringers is investigated analytically using the wave approach of Mead (1976). Numerical results are presented in extensive tables and graphs and compared with published data on bare panels. Constrained damping on the flanges is shown to give higher overall damping than unconstrained damping, with maximum effect in the stringer bending mode and minimum effect in the stringer torsion mode. The improvement in overall damping due to damped stringers is found to be marginal. T.K.

AN INVESTIGATION OF THE STRUCTURE OF A GROUND-TRAILING VORTEX

GUOCAI TANG (Nanjing Aeronautical Institute, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 5, Sept. 1987, p. 271-277. In Chinese, with abstract in English.

A detailed experimental investigation is presented on the structure of the trailing vortex from a ground vortex. The experiment was conducted in the MIT W. B. wind tunnel. Measurements were made with a five-hole probe to obtain velocity vector distributions along two rectangular contours, giving circulations and the location of the vortex center. The difference between the two circulations and the feature of the flow field along the engine outer surface suggests a sheet-like structure of the trailing vortex with most of the vorticity concentrated in the vortex core. The results thus not only bear out quantitatively the existence of the ground-trailing vortex but also reveal for the first time the sheet-like structure of the trailing vortex and provide a flow model for this new flow phenomenon. FORUM ON UNSTEADY FLOW SEPARATION, CINCINNATI, OH, JUNE 14-17, 1987, PROCEEDINGS

KIRTI N. GHIA, ED. (Cincinnati, University, OH) Forum sponsored by ASME. New York, American Society of Mechanical Engineers, 1987, 255 p. For individual items see A88-14142 to A88-14167.

Papers are presented on nonlinear neutral modes in the Blasius boundary layer, the response of a delta wing in steady and unsteady flow, a numerical simulation of vortex breakdown, and strong blade-vortex interactions, including collision. Also considered are break-up in unsteady separation, unsteady separation at low Reynolds numbers, subharmonic instability in boundary layers, and the flow structure in the wake of an oscillating cylinder. Other topics include the simulation of unsteady flow separation, features of transitional separation bubbles in an oscillating freestream, the effect of pitch location on dynamic stall, and flow separation in dump combustors. R.R.

BREAK-UP IN UNSTEADY SEPARATION

F. T. SMITH (University College, London, England) IN: Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 55-64. refs

The unsteady break-up of otherwise steady or unsteady separating flows, and unsteady boundary layers in general, is addressed theoretically. The aspects involved are intimately bound up with transition to turbulence in practice. The first aspect is the prediction of the critical position for enhanced instability to occur in separating flow. The second, as a consequence, is the break-up of a separated eddy due to nonlinear unsteady effects, on the small or the large scale. The third aspect is the nonlinear receptivity of attached and separating flows to freestream disturbances. Fourth, and again in consequence, the complete break-up of an unsteady interacting boundary layer is described. Two-versus three-dimensional effects, comparisons with some experimental

and computational results, and applications in a number of external and internal flows are also discussed. Author

THE CALIBRATION AND OPERATION OF A CONSTANT-TEMPERATURE CROSSED-WIRE PROBE IN SUPERSONIC FLOW

E. M. FERNANDO, J. F. DONOVAN, and A. J. SMITS (Princeton University, NJ) IN: Symposium on Thermal Anemometry, Cincinnati, OH, June 14-17, 1987, Proceedings. New York, American Society of Mechanical Engineers, 1987, p. 43-49. refs (Contract NAG1-545)

The calibration and operation of a constant-temperature crossed-wire probe in supersonic flow is considered. Crossed-wire probes offer considerable advantages over single, inclined wires: the kinematic shear stress can be derived from a single point measurement; the rms quantities can be derived from the same measurement, and the instantaneous quantities can be obtained as a continuous function of time. However, using a crossed-wire probe in supersonic flow is subject to the following practical difficulties: the problem of flow interference, where the shock waves from one wire and its supports interfere with the flow over the other wire; the necessity for high frequency response to resolve the spectral content, and the sensitivity of the results to small changes in the calibration constants. In the present contribution, each of these problems is addressed. Practical solutions are suggested, and some encouraging results are presented. Author

A STUDY OF A MULTI-LAYERED THIN FILM HEAT TRANSFER GAUGE AND A NEW METHOD OF MEASURING HEAT TRANSFER RATE WITH IT

MASANORI HAYASHI, AKIRA SAKURAI, and SHIGERU ASO (Kyushu University, Fukuoka, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 30, Aug. 1987, p. 91-101. Translation. Previously cited in issue 10, p. 1378, Accession no. A86-25228. refs

A new method of measuring heat transfer rate with high spatial resolution and fast response is developed to be used in wind tunnels with long flow duration. For the development of the new method a multilayered thin-film heat transfer gage is proposed. The principle of the sensor is based on measuring the temperature gradient across a thin heat-resistant layer of SiO with two thin film resistance thermometers on its upper and lower surfaces. These thin films and the heat-resistant layer are deposited by the vacuum evaporation technique. The design considerations, the accuracy of the sensor, the frequency response, and the calibration technique are discussed. The sensor is applied to the measurement of the heat transfer rate in a turbulent boundary layer on a flat plate at Mach number 4, $T_w/T_0 = 0.64$, and $Re = 1.4 \times 10^6$ to the 7th, and shows high sensitivity and fast response. It also shows excellent durability. Author

DO WE REALLY UNDERSTAND MAINTENANCE?

THOMAS D. MATTESON AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 6 p. refs (AIAA PAPER 87-2943)

The design of applicable and effective maintenance programs requires a body of knowledge that is distinct from that entailed in ensuring aircraft maintainability. The results of actuarial analyses for a wide range of items have disproved several historically dominant beliefs concerning the effects of age on complex hardware reliability. Maintenance requirements should focus on maintaining function, rather than all the physical characteristics of a design. These reliability-centered maintenance practices are presently discussed. O.C.

OBSERVERS FOR FAILURE DETECTION OF ACTUATION SYSTEMS

HAGOP V. PANOSSIAN (HR Textron, Inc., Valencia, CA) IN: ISTFA 1986 - International Symposium for Testing and Failure Analysis; Proceedings of the Symposium, Los Angeles, CA, Oct. 20-24, 1986. Metals Park, OH, ASM International, 1986, p. 275-278. refs

The states and parameters of an actuation system are estimated using realistic measurements. Linear observers are utilized on a linear model of a hydraulic actuation system generated through linearization under appropriate conditions. Both deterministic and stochastic observers are applied, the latter under realistic state and measurement noise. A procedure is outlined whereby these estimates can be used for detecting and isolating anomalous behavior that could lead to total failures. Results from simulations are presented in plots indicating values of states and parameters versus their respective estimates. The implications of the behaviors of the states and parameters are related to failure detection and isolation. Author

ANALYZING FAILURES: THE PROBLEMS AND THE SOLUTIONS

V. S. GOEL, ED. Metals Park, OH, ASM International, 1986, 362 p. For individual items see A88-15114 to A88-15116.

Papers are presented on a failure analysis of a large centrifugal blower, field fractures in heavy equipment, a failure analysis of a liquid propane gas cylinder, an analysis of helicopter blade fatigue fracture by digital fractographic imaging analysis, and the influence of failure analyses on materials technology and design. Also considered are an analysis of aircraft component failures, the growth of short cracks in IN718, the improper fabrication of rotating blades (resulting in premature failure), and low cycle thermal fatigue and fracture of reinforced piping. Other topics include a nonlinear finite element analysis of stress concentration at high temperature, the inelastic analysis of a hot spot on a heavy vessel wall, the accuracy and precision of mechanical test data generated using computerized testing systems, and maintenance related failures. R.R.

FAILURE ANALYSES OF STEEL BREECH CHAMBERS USED WITH AIRCRAFT CARTRIDGE IGNITION STARTERS

PHILIP C. PERKINS, RAYMOND D. DANIELS (Oklahoma, University, Norman), and A. BRUCE GILLIES (USAF, Oklahoma City Air Logistics Center, Tinker AFB, OK) IN: Analyzing failures: The problems and the solutions. Metals Park, OH, ASM International, 1986, p. 143-149. (Contract F34601-85-C-0791)

Cartridge-pneumatic starter systems are used in military aircraft. In the cartridge mode used for alert starts, the starter turbine is driven by hot gases produced through the controlled burning of a solid propellant cartridge within a closed chamber. Premature failures of steel breech chambers have been prevalent enough to cause serious concern. Factors identified as significant in the

12 ENGINEERING

failures are the pressure developed in the chamber and internal corrosion of the chamber in an environment that can produce stress corrosion cracking. The interior configuration of the chamber and the stress distribution also have a bearing upon the failure modes. Several failures are reviewed to illustrate the problems.

FATIGUE LIFE: ANALYSIS AND PREDICTION

V. S. GOEL, ED. Metals Park, OH, American Society for Metals, 1986, 427 p. No individual items are abstracted in this volume.

Theoretical and practical aspects of fatigue life prediction are examined in reviews and reports. Topics discussed include fatigue resistance and safety of butt welds, H₂ and humidity effects on the fatigue behavior of a 70-30 Cu-Ni alloy, fatigue cracking of Ti tubes in an industrial heat exchanger, and subcritical growth of small fatigue cracks. Consideration is given to failure analysis of miniature bearings, computer-controlled fatigue crack growth rate testing using the J integral, modeling strain-ratio effects on low-cycle fatigue life, and ultrasonic characterization of crack closure.

THREE-DIMENSIONAL PHOTOELASTIC ANALYSIS OF AEROENGINE ROTARY PARTS

K. UCHINO, T. KAMIYAMA, T. INAMURA, K. SIMOKOHGE, H. AONO (Ishikawajima-Harima Heavy Industries Co., Ltd., Ohtemachi, Japan) et al. IN: Photoelasticity; Proceedings of the International Symposium, Tokyo, Japan, May 13-15, 1986. Tokyo and New York, Springer-Verlag, 1986, p. 209-214.

The role of three-dimensional photoelasticity in the design of the flow path of aircraft gas turbine engines is examined with reference to specific examples. In particular, two examples (a double stress concentration problem in blade-disk attachment and the problem of an annulus filler with complicated three-dimensional features) are shown to demonstrate the importance of three-dimensional elasticity in predicting stress distributions in rotary parts of very complex geometry. It is emphasized that the combined use of numerical and experimental methods provides a more accurate design tool for modern gas turbine engines.

NUMERICAL MODELING OF STATIONARY SEPARATED FLOWS

V. M. KOVENIA, V. I. PINCHUKOV, and S. G. CHERNYI (AN SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR) IN: BAIL IV; Proceedings of the Fourth International Conference on Boundary and Interior Layers - Computational and Asymptotic Methods, Novosibirsk, USSR, July 7-11, 1986. Dun Laoghaire, Ireland, Boole Press, 1986, p. 117-129. refs

Viscous separated flows are studied in the approximation of complete and simplified Navier-Stokes (NS) equations of a compressible gas. The problem of stationary transonic flow of a viscous gas stream around an airfoil is considered, and the stationary solution of the NS equations is found by using a conservative, absolutely stable scheme based on the relaxation principle. Then, stationary flows are studied in the approximation of parabolized NS equations.

A NONLINEAR, ASYMPTOTIC INVESTIGATION OF THE STATIONARY MODES OF INSTABILITY OF THE THREE-DIMENSIONAL BOUNDARY LAYER ON A ROTATING DISC

SHARON MACKERRELL (Exeter, University, England) Royal Society (London), Proceedings, Series A - Mathematical and Physical Sciences (ISSN 0080-4630), vol. 413, no. 1845, Oct. 8, 1987, p. 497-513. refs

There exist two types of stationary instability of the flow over a rotating disk, corresponding to the upper inviscid mode and the lower-branch mode (which has a triple-deck structure) of the neutral stability curve. The linear problem has been investigated by Hall (1986), and the asymptotic structure of the wavenumber and

orientation of these modes has been obtained. Here, a nonlinear investigation of high-Reynolds-number stationary instabilities in the three-dimensional boundary layer on a rotating disk is given for the lower-branch mode. By considering nonlinear effects and following the framework set up by Hall, asymptotic solutions are obtained that enable the finite amplitude growth of a disturbance close to the neutral location to be described.

THE DEVELOPMENT OF A STANDARD ELECTRONIC MODULE WITH MIL-STD-1750A CAPABILITIES

JOSEPH P. FISCHER (McDonnell Douglas Electronics Co., Saint Charles, MO) IN: Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 17-22. refs (SAE PAPER 860838)

This paper describes the development of a standard size and function electronic module to meet the requirements of aircraft technology advances and future military aircraft avionics systems. The standard electronic module developed utilizes a MIL-STD-1750A central processing unit and is designed for applications requiring a general data processor. Design goals included MIL-STD-1750A compatibility, nonvolatile, high speed memory, memory management options, interfacing to a common bus backplane, the use of surface mount technology, application of new material and process techniques, and high speed I/O and direct memory access. Second generation development of this electronic module will incorporate VHSIC technology.

ADVANCED MIL-STD-1553 UHF/VHF RADIO

PAUL F. CHRISTIANO (Northrop Corp., Advanced Systems Div., Pico Rivera, CA) IN: Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 23-29. (SAE PAPER 860840)

Hardware and software for the control of multiple UHF/VHF radios aboard an aircraft via the MIL-STD-1553 data bus are described, and the system architecture is illustrated with extensive diagrams and flow charts. The system comprises independent multipurpose display/entry units, a bus-control processor, an audio control distribution unit, and the radios and antennas. The characteristics of the radios are reviewed, and the control operation is outlined. The use of the MIL-STD-1553 bus is shown to simplify radio operation, reduce crew intervention requirements, and provide crew and maintenance personnel with accurate information on the operating capabilities of damaged or malfunctioning radios.

A88-15581**AIRCRAFT/STORES DATA BUS NETWORKS**

RICHARD A. FLANAGAN (Boeing Military Aircraft Co., Wichita, KS) and DAMON G. SIMPSON (Raychem Corp., Menlo Park, CA) IN: Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 35-43. (SAE PAPER 860842)

The integration of data bus military standard MIL-STD-1553 into an aircraft stores management system is unique. The number of remote terminals connected to the network is not constant. Weapons and their remote terminals are physically separated from the network during normal operation. This creates dynamic changes in the electrical loading of the network. Laboratory network integration tests were performed for both fighter and bomber single level networks. Single and multiple stores releases were simulated. Test results allow designers to understand the effects of coupler spacing, stub length and weapon releases on the performance of stores data bus networks. Author

A88-15583**AN OVERVIEW OF SAE AE-9B HIGH SPEED RING BUS (HSRB) PERFORMANCE**

ROBERT J. DELCOCO, BRIAN W. KROEGER, and JOHN J. KURTZ (Westinghouse Electric Corp., Pittsburgh, PA) IN: Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 55-68. refs (SAE PAPER 860844)

The design, operating principles, and theoretical performance of a standard high-speed token-passing ring bus (HSRB) are described and illustrated with diagrams and graphs. The HSRB is being developed by the SAE AE-9B subcommittee to meet future military (ship and aircraft) requirements for high-speed local-area networking. Consideration is given to priority and short-message operations, the token frame, the message-frame format, minimal-station-delay protocols, ring synchronization, and fault-recovery methods. Comparative calculations show the performance of an optimized HSRB at 100 Mb/s to be superior to that of a linear contention bus or a linear token-passing bus. If maximum and average message length are kept to 512 and 100 words, respectively, it is estimated that the HSRB can attain throughput efficiency greater than 90 percent and high-priority-message latency time less than 500 microsec. T.K.

A88-15585**UTILITIES SYSTEMS MANAGEMENT - FLYING DEMONSTRATOR**

I. MOIR and P. H. CAPENER (Smiths Industries Aerospace and Defence Systems, Ltd., London, England) IN: Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 77-87. (SAE PAPER 860851)

The design and operation of the utilities systems management (USM) hardware developed for the UK Experimental Aircraft Program (EAP) demonstrator are presented in extensive drawings and diagrams and briefly characterized. The USM links the basic aircraft systems (fuel, engine, environmental control, secondary power, hydraulics, etc.) to the avionics or mission bus. It comprises a dedicated MIL-STD-1553B bus, distributed data-acquisition units with local processing and control, an integrated power control, and interfaces with the multifunction displays of the digital cockpit. The overall operation of the USM is outlined; and the system implementation and packaging are discussed. Particular attention is given to the use of relays (rather than solid-state devices) for discrete power switching. When compared to conventional utilities control systems, the USM is shown to provide weight and operating-cost savings of over 50 percent and an eightfold improvement in availability. T.K.

A88-15586**SOFTWARE CONSIDERATIONS FOR INTERFACING AVIONICS COMPUTERS AND MUX BUSES**

S. LLOYD PLEHATY (Norden Systems, Inc., Norwalk, CT) IN: Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings. Warrendale, PA, Society of Automotive Engineers, Inc., 1986, p. 89-94. refs (SAE PAPER 860853)

The impact of avionics-system complexity on the design of interface bus terminals to link MIL-STD-1750A computers with MIL-STD-1553B data buses is discussed, with a focus on software aspects. The characteristics of typical state-of-the-art avionics are reviewed, including simple synchronous systems, complex multimode systems, and asynchronous systems. Consideration is given to bus features such as message chaining, selective interrupts, automatic retry, memory addressing, I/O buffering, buffer-access conflicts, terminal control, and I/O processing. The need for standardized smart bus terminals capable of handling asynchronous I/O is stressed, and it is suggested that such standards could facilitate the development of standardized software drivers and software tools. A88-16344#**AN APPROXIMATE APPROACH TO ESTIMATE THE DYNAMIC CHARACTERISTICS OF AEROELASTIC SYSTEM**

YI LU and CHENGZHONG LI (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 8, June 1987, p. B299-B304. In Chinese, with abstract in English. refs

This paper gives a method for obtaining approximately the eigenvalues and eigenvectors of an aeroelastic system in an unsteady aerodynamic environment in an arbitrary state. The method is valid for motion with multiple degrees of freedom and extends the relationship between the decay rate of structural motion and the fictitious structural damping coefficients and frequencies of the V-g method. The calculated results show that the present method is satisfactory in estimating the dynamic characteristics of aeroelastic systems. By comparison with the p-k method, the augmented-state method, and the graphical techniques, the advantage of the proposed method is its simplicity. Author

STOCHASTIC MODAL INTERACTION IN LINEAR AND NONLINEAR AEROELASTIC STRUCTURES

R. A. IBRAHIM and Z. HEDAYATI (Texas Tech University, Lubbock) Probabilistic Engineering Mechanics (ISSN 0266-8920), vol. 1, Dec. 1986, p. 182-191. refs
(Contract AF-AFOSR-85-0008)

The linear, parametric, and autoparametric random responses in a three degree-of-freedom structure submitted to wide band excitation are investigated. Mean square responses are obtained for models with constant parameters and with random variations in stiffness matrix. The Fokker Planck equation method and a Gaussian closure scheme are used to determine the nonlinear random response of the system in the neighborhood of combination internal resonance. The response is shown to deviate from the linear solution when the system internal detuning is close to the exact internal resonance, and the autoparametric interaction is shown to depend on the system damping ratios and a nonlinear coupling parameter. RESPONSE OF STIFFENED PANELS FOR APPLICATIONS TO ACOUSTIC FATIGUE

R. VAICAITIS (Columbia University, New York) and S. T. CHOI AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 12 p. refs
(Contract NAG1-541)
(AIAA PAPER 87-2711)

The surface protection systems of aerospace and aircraft structures are often constructed from discretely stiffened panels. This paper presents an analytical study on dynamic stress response of these structures to random surface flow and acoustic loads. To account for aerodynamic heating of high speed flow, thermal effects are included in the structural model. A generalized transfer matrix procedure is developed to obtain the required dynamic response solutions. Numerical results include spectral densities of stress, response root mean square values and fatigue damage for a variety of loading and thermal conditions. Author

MULTIPLE-MODE LARGE DEFLECTION RANDOM RESPONSE OF BEAMS WITH NONLINEAR DAMPING SUBJECTED TO ACOUSTIC EXCITATION

C. B. PRASAD (Analytical Services and Materials, Inc., Hampton, VA) and CHUH MEI (Old Dominion University, Norfolk, VA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 18 p. refs
(Contract NAS1-17993)
(AIAA PAPER 87-2712)

Multiple-mode nonlinear analysis is carried out for beams subjected to acoustic excitation. Effects of both nonlinear damping and large-deflection are included in the analysis in an attempt to explain the experimental phenomena of aircraft panels excited at high sound pressure levels; that is the broadening of the strain response peaks and the increase of modal frequency. An amplitude dependent nonlinear damping model is used in the analysis to study the effects and interactions of multiple modes, nonlinear stiffness and nonlinear damping on the random response of beams. Mean square maximum deflection, mean square maximum strain, and spectral density function of maximum strain for simple supported and clamped beams are obtained. It is shown analytically that nonlinear damping contributes significantly to the broadening of the response peak and to the mean square deflection and strain. Author

A FINITE ELEMENT LARGE DEFLECTION RANDOM RESPONSE ANALYSIS OF BEAMS AND PLATES SUBJECTED TO ACOUSTIC LOADING

CHUH MEI (Old Dominion University, Norfolk, VA) and C. K. CHIANG AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 11 p. refs
(Contract F33615-86-C-3230; NAS1-17993)
(AIAA PAPER 87-2713)

A finite element formulation is presented for the analysis of beams and rectangular plates undergoing large deflections subjected to Gaussian white noise excitations. Single-mode response is assumed in the present formulation. Root-mean-square (RMS) maximum deflections for simply supported and clamped beams and plates at various sound spectrum levels are obtained and compared with solutions using the Fokker-Planck-Kolmogorov equation and the equivalent linearization methods. RMS maximum strains and equivalent linear frequencies are compared with the equivalent linearization results for assessment of the accuracy of the finite element method. Author

VIBRATION ANALYSIS OF FLAT SKIN-STRINGER STRUCTURES BY THE SUPER MATRIX METHOD

G. COMTE-BELLOT, B. GAY (Lyon, Ecole Centrale, Ecully, France), and C. FRANCO (Framatome, Paris-la-Defense, France) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. Research sponsored by Aerospatiale. refs
(AIAA PAPER 87-2734)

The super matrix method is presented as a technique for analyzing the forced vibrations of large stiffened structures composed of panels and stringers such as airplane fuselages. It is shown that this method can produce accurate modal forms in structures of up to 21 panels. External excitation can be concentrated or distributed as in the case of propagating acoustic waves. Applications concern aircraft cabin noise. Author

JET IMPINGEMENT HEAT TRANSFER - A LITERATURE SURVEY

S. J. DOWNS (Rolls-Royce, PLC, Derby, England) and E. H. JAMES (Loughborough University of Technology, England) ASME, AIChE, and ANS, National Heat Transfer Conference and Exhibition, 24th, Pittsburgh, PA, Aug. 9-12, 1987. 11 p. refs
(ASME PAPER 87-HT-35)

A literature survey had been carried out as part of background investigations relating to research by the author. The search was biased towards obtaining information concerning the heat transfer characteristics of round impinging jets, although slot nozzles were covered where relevant as were nonimpinging jets. This paper summarizes the findings of the literature review, covering forty-seven papers describing experimental investigations and theoretical analyses. Author

THE USE OF SPEECH TECHNOLOGY IN AIR TRAFFIC CONTROL SIMULATORS

J. A. HARRISON, G. R. HOBBS, J. R. HOWES, and N. COPE (Ferranti Computer Systems, Ltd., Bracknell, England) IN: International Conference on Simulators, 2nd, Coventry, England, Sept. 7-11, 1986, Proceedings. London, Institution of Electrical Engineers, 1986, p. 15-19.

The advantages of applying speech technology to air traffic control (ATC) simulators are discussed with emphasis placed on the simulation of the pilot end of the pilot-controller dialog. Speech I/O in an ATC simulator is described as well as technology capability, and research on an electronic blip driver. It is found that the system is easier to use and performs better for less experienced controllers. K.K.

HEAT REMOVAL KEY TO SHRINKING AVIONICS

GEORGE P. PETERSON (Texas A & M University, College Station) Aerospace America (ISSN 0740-722X), vol. 25, Oct. 1987, p. 20-22.

An evaluation is made of the consequences for avionics miniaturization and performance improvement of recent advancements in heat pipe technology. In a heat pipe, the phase change of a working fluid can yield levels of thermal conductivity that are several orders of magnitude greater than solid conductors. Current interest extends to large heat pipes (0.3 m or greater in length), medium-sized heat pipes on which electronic components are mounted, and microheat pipes, whose dimensions are of the order of 5 cm length and 1 mm diameter. THREE-DIMENSIONAL CALCULATION IN HIGH SUBSONIC AXIAL COMPRESSOR ROTOR AND ITS COMPARISON WITH L2F VELOCITY MEASUREMENT Abstract Only

QINGHUAN WANG *In its* JPRS report: Science and Technology. China p 32 14 Jul. 1987 Transl. into ENGLISH from Gongcheng Rewuli Xuebao (Beijing, Peoples Republic of China), v. 8, no. 2, May 1987 p 119-124 Original language document was announced in IAA as A87-51809

Avail: NTIS HC A07/MF A01

As a part of the basic research program to increase the understanding of the internal flow in high subsonic and transonic flow compressors and to improve the design and analysis calculation methods, a two-focus laser velocimeter has been employed in measuring the velocity and the flow angles in a compressor rotor running at peak efficiency points of several partial design speeds. Three-dimensional flow calculation has also been undertaken for these off-design conditions. The outlet velocity measured by the velocimeter, outlet stagnation pressure measured by pitot tubes, and isentropic rotor efficiency measured by a phase difference torque meter are used as input values to the theoretical calculation. The variation of flow on the S (2m) surface and on the S1 surfaces, as measured by the velocimeter, agrees reasonably well with the calculated variation. This indicates that the three dimensional calculation method used can give a good picture of the internal flow in the compressor rotor. Author

A medium gain antenna was developed for direct reception of the MARECS satellite. The antenna system is conformal with the outer skin of the airplane. It was designed as a phased-array system consisting of six individual elements placed in a vertical row. The radiation pattern can be moved in elevation, and can thus be pointed towards the satellite. The halfwidth in elevation direction is 17 deg arc, and in azimuthal direction 20 deg arc. The measurements show a gain between 9 and 10.8 dBi, depending on the lobe, and an efficiency of 65%. The suppression of the mirror reflection by the antenna diagram is between -20 and -25 dB. ESA

ON THE SCHEME DEPENDENCY OF THE THREE-DIMENSIONAL EULER SOLUTIONS

YOKO TAKAKURA, TOMIKO ISHIGURO, and SATORU OGAWA (National Aerospace Lab., Tokyo, Japan) *In* Tokyo Univ., The Proceedings of the Symposium on Mechanics for Space Flight p 31-45 Mar. 1987

Avail: NTIS HC A09/MF A01

The modification of the recent total variation diminishing (TVD) schemes with regard to treatment of metric is presented, and the estimation for the TVD schemes and the conventional Beam-Warming scheme is performed by comparing the computational results for the three-dimensional flows about the ONERA-M6 wing with the experimental data. Modified TVD schemes are proved to be reasonable when applied to the three-dimensional Euler equation in general curvilinear coordinates and the characteristics of each scheme have been captured. It was verified for each scheme that it should be made to agree with accuracy of fluxes; otherwise, modification of maintaining freestream should be used. The modified TVD schemes yield excellent solutions with few numerical oscillations for even strong shock waves and a high ability of capturing the leading edge expansion and weak shock waves. The negative side is high cost and inapplicability to three-dimensional problems because weak shock waves are missed. Author

NUMERICAL STUDY OF THE ENTRANCE FLOW AND ITS TRANSITION IN A CIRCULAR PIPE (2)

H. KANDA and K. OSHIMA *In* Tokyo Univ., The Proceedings of the Symposium on Mechanics for Space Flight p 47-76 Mar. 1987

Avail: NTIS HC A09/MF A01

The experimental data and results of prior investigations lead to defining the problem of the transition from laminar to turbulent flow in a circular pipe. The flow field of a circular pipe is examined with particular emphasis on the entrance and transition length, using a two-dimensional computational scheme. Symmetric disturbances were superimposed on points near the inlet and wall of the pipe. It was found for the first time that the transition length is predicted fairly satisfactorily by the computational simulation. A numerical, finite-difference method is shown to simulate development of the Hagen-Poiseuille flow and transition to turbulent flow. Conclusions are: (1) the turbulence transition occurs only within the entrance region; (2) the transition length decreases as the Reynolds number increases under the same inlet conditions; (3) a good bellmouth lessens disturbances at the inlet and the critical Reynolds number becomes larger; (4) the transition is numerically simulated on the conditions that the aspect ratios of the rectangular mesh system are 2 for $Re=2,700$ and 1 for $Re=10,000$ and that the disturbance is given at the point very near the wall of the inlet; and (5) the result of simulation satisfies two theorems of Rayleigh (dependence of the flow stability on laminar velocity profiles). CRACK INITIATION AND PROPAGATION DUE TO CYCLIC THERMAL GRADIENTS

PIERRE-MARIE LESNE Sep. 1987 182 p Transl. into ENGLISH of Amorcage et Propagation de Fissures sous Gradients Thermiques Cycliques (Chatillon, France) Original language document was previously announced as N87-13829 (ESA-TT-1023; ONERA-P-1985-2; ETN-87-91112) Avail: NTIS HC A09/MF A01

Tests were made on a simple thin plate of IN100 superalloy approximating the shape of a turbine blade, in which crack initiation and propagation by thermal fatigue were produced, to develop a method for predicting the creep-fatigue lifetime of such structures under variable temperature conditions. A finite element method including cyclic viscoplastic constitutive equations was used to calculate the stresses and plastic strains at every point on the blade at successive cycles, using the temperature distribution maps and variable-temperature constitutive equations as given data. The crack initiation can be calculated from the variable-temperature fatigue damage and creep laws, using the hysteresis loop at the stabilized (12th) cycle. Crack propagation, carefully measured during the tests, is predicted by a method based on linear fracture mechanics, taking the viscoplastic behavior of the material into account. The calculation/test comparison is good for initiation and propagation. ESA

A STUDY OF TWO-PHASE FLOW IN A REDUCED GRAVITY ENVIRONMENT Final Report

D. HILL and ROBERT S. DOWNING 16 Oct. 1987 173 p (Contract NAS9-17195) (NASA-CR-172035; NAS 1.26:172035; DRL-T-1884; DRD-TM-478T) Avail: NTIS HC A08/MF A01 CSDL 22A

A test loop was designed and fabricated for observing and measuring pressure drops of two-phase flow in reduced gravity. The portable flow test loop was then tested aboard the NASA-JSC KC135 reduced gravity aircraft. The test loop employed the Sundstrand Two-Phase Thermal Management System (TPTMS) concept which was specially fitted with a clear two-phase return line and condenser cover for flow observation. A two-phase (liquid/vapor) mixture was produced by pumping nearly saturated liquid through an evaporator and adding heat via electric heaters. The quality of the two-phase flow was varied by changing the evaporator heat load. The test loop was operated on the ground before and after the KC135 flight tests to create a one-gravity data base. The ground testing included all the test points run during the reduced gravity testing. Two days of reduced gravity tests aboard the KC135 were performed. During the flight tests, reduced-gravity, one-gravity, and nearly two-gravity accelerations were experienced. Data was taken during the entire flight which provided flow regime and pressure drop data for the three operating conditions. The test results show that two-phase pressure drops and flow regimes can be accurately predicted in zero-gravity.

EXCITATION OF NATURAL OSCILLATIONS OF A BOUNDARY LAYER BY AN EXTERNAL ACOUSTIC FIELD Abstract Only

A. A. MASLOV and N. V. SEMENOV In its USSR Report: Engineering and Equipment p 92 28 May 1987 Transl. into ENGLISH from Izvestiya Akademii Nauk SSSR Mekhanika Zhidkosti i Gaza (Moscow, USSR), no. 3, May - Jun. 1986 p 74-78 Previously announced as X87-71990 Avail: NTIS HC A06/MF A01

Experimental studies of the susceptibility of the supersonic boundary layer to undergo the transition from laminar to turbulent flow were undertaken. It was found that there are areas on the plate of most effective conversion of external acoustic disturbances to natural oscillations of the supersonic boundary layer. The leading edge of the plate, acoustical branch of the neutral curve and lower branch of the curve of neutral stability are such areas. Experiments were performed in a T-325 supersonic wind tunnel

with reduced turbulence in a 200 by 200 mm cross-section.

DYNAMICS OF REVERSE FLOWS AT PUMP INLET Abstract Only

N. S. YERSHOV In its USSR Report: Engineering and Equipment p 93 28 May 1987 Transl. into ENGLISH from Izvestiya Vysshikh Uchebnykh Zavedeniy: Aviatsonnaya Tekhnika (Kazan, USSR), no. 4, Oct. - Dec. 1985 p 49-53 Avail: NTIS HC A06/MF A01

Under stationary conditions, due to the effect of cavitation on the aerodynamics between the blading and the flow, the length of the zone of reverse flows decreases and the field of velocities in each section is distorted. The boundary of reverse flows is a place where the reverse flow and an unperturbed flow meet at the inlet pipe wall. An equation was derived that gives a mathematical description of a phenomenon which was observed in the case of self-excited oscillations, when at a certain stage of the process the length of the reverse flows increases. This phenomenon was in contradiction with earlier conceptions. The derived equations could be used for construction of a pump operating with reverse flows.

CALCULATION OF THE TRIBOLOGICAL PROPERTIES OF SURFACES BY SEMI-EMPIRICAL METHODS

JON T. SWANSON and JAMES J. STEWART Jul. 1987 10 p (AD-A184283; FJSRL-TR-87-0005) Avail: NTIS HC A02/MF A01 CSDL 11H

One method of increasing the performance of aircraft engines is to operate the engines at higher temperatures. A critical technology in this application is lubrication at high temperatures. A thorough understanding of solid lubrication of ceramic materials is therefore required. This report details our initial attempts at preparing a semi-empirical quantum chemical model of solid lubricants. In our initial study we focused on two areas of the problem. The first area was to determine the best approach to treating a model surface or lubricant. The selection was governed by providing a reasonable model without requiring an unreasonable amount of computer time for each calculation. The second area concerned obtaining an estimate of the ability of the above models to calculate the relatively weak interactions which occur between surfaces and lubricants, and between the lubricants themselves. Our first concern was to reproduce the trends, rather than obtain the absolute values in these interactions. GRA

MEASURED PERFORMANCE OF THE HEAT EXCHANGER IN THE NASA ICING RESEARCH TUNNEL UNDER SEVERE ICING AND DRY-AIR CONDITIONS

W. OLSEN, J. VANFOSSSEN, and R. NUSSLE Dec. 1987 29 p (NASA-TM-100116; E-3661; NAS 1.15:100116) Avail: NTIS HC A03/MF A01 CSDL 13I

Measurements were made of the pressure drop and thermal performance of the unique refrigeration heat exchanger in the NASA Lewis Icing Research Tunnel (IRT) under severe icing and frosting conditions and also with dry air. This data will be useful to those planning to use or extend the capability of the IRT and other icing facilities (e.g., the Altitude Wind Tunnel-AWT). The IRT heat exchanger and refrigeration system is able to cool air passing through the test section down to at least a total temperature of -30 C (well below icing requirements), and usually up to -2 C. The system maintains a uniform temperature across the test section at all airspeeds, which is more difficult and time consuming at low airspeeds, at high temperatures, and on hot, humid days when the cooling towers are less efficient. The very small surfaces of the heat exchanger prevent any icing cloud droplets from passing through it and going through the tests section again. The IRT heat exchanger was originally designed not to be adversely affected by severe icing. During a worst-case icing test the heat exchanger iced up enough so that the temperature uniformity was no worse

than about ± 1 deg C. The conclusion is that the heat exchanger design performs well.

CHARGE SIMULATION METHOD FOR THE CALCULATION OF ELECTROMAGNETIC FIELDS RADIATED FROM LIGHTNING

P. RATNAMAHILAN, P. HOOLE (Oxford University, England), S. RATNAJEEVAN, and H. HOOLE (Drexel University, Philadelphia, PA) IN: Betech 86; Proceedings of the Second Boundary Element Technology Conference, Cambridge, MA, June 17-19, 1986. Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, p. 153-169. Research supported by the Culham Lightning Club. refs

Lightning is an electrical phenomenon in which many physical processes combine to produce the majestic flash. The modeling of the leader and return strokes requires good electromagnetic field calculation methods to test the model as well as to determine fields at any point in space and time. The well known charge simulation method could be directly used for leader stroke computations. An extension of the principles of the method is presented here to determine the transient fields radiated from lightning return strokes. The method is simple to use, shown to give accurate results, and may be applied to branched lightning.

(Contract NAS1-17748)

(NASA-CR-4104; NAS 1.26:4104; EMA-87-R-37) Avail: NTIS HC A06/MF A01 CSCL 04B

The triggered lightning environment of the F106B aircraft is investigated. Scale modeling of the F106B with a metallized model was done to measure electric field enhancement factors on the aircraft and on canonically shaped conducting objects. These are then compared to numerically determined quantities. Detailed numerical modeling is done of the development of the triggered lightning channel. This is done using nonlinear air chemistry models to model a variety of physical phenomena which occur in a triggered lightning event. The effect of a triggered lightning strike on internal wires in the F106B is investigated using finite difference models and transmission line models to calculate the electromagnetic coupling of lightning currents through seams and joints of the aircraft to internal cables. Time domain waveforms are computed and compared to measured waveforms. The effect of thunderstorm particles on the initial triggering of a lightning strike is investigated. The electric field levels needed to cause air breakdown in the presence and absence of thunderstorm particles are calculated. This is done as a function of the size, shape, and density of the particles.

BETECH 86; PROCEEDINGS OF THE SECOND BOUNDARY ELEMENT TECHNOLOGY CONFERENCE, MIT, CAMBRIDGE, MA, JUNE 17-19, 1986

J. J. CONNOR, ED. (MIT, Cambridge, MA) and C. A. BREBBIA, ED. (Computational Mechanics Institute, Southampton, England) Southampton, England and Billerica, MA, Computational Mechanics Publications, 1986, 837 p. For individual items see A88-13258 to A88-13283.

Papers are presented on the role of boundary elements in CIM, boundary elements for high intensity electric field computation in scientific instruments, a charge simulation method for the calculation of electromagnetic fields, and new developments in coupled thermoelastic analysis by BEM. Also considered are a boundary element formulation of steady heat transfer of thin plates, a boundary element approach to a free-wake analysis of helicopter rotors, and potential hydrodynamic effects on structures by the BEM. Other topics include BEM for laminar motion of isochoric viscous flows, BEM in elastic torsional problems using Green's generalized theorem and R-functions, and an indirect boundary integral equation for spherical shells. Papers are also presented on cracks at stress concentrators, a boundary element technique for poroelasticity, shape optimization utilizing a boundary element formulation, and some experimental results with nonconforming elements.

REAL-TIME OPERATIONAL PLANNING FOR THE U.S. AIR TRAFFIC SYSTEM

JOHN M. MULVEY (Princeton University, NJ) and STAVROS A. ZENIOS (Pennsylvania, University, Philadelphia) Applied Numerical Mathematics (ISSN 0168-9274), vol. 3, Oct. 1987, p. 427-441. Research supported by the Alfred P. Sloan Foundation. refs (Contract NSF DCR-84-01098; NAG1-520)

This paper describes an integrated planning model for the U.S. air traffic system. The approach incorporates the dual objectives of monitoring collision risk while minimizing transportation costs. Specialized solution algorithms exploit the underlying structure of the model - especially for large-scale examples. The proposed formulation is tested with real-world data for the Indianapolis control sector. Additional experiments with a CRAY X-MP/24 supercomputer show that a full-scale model can be solved under real time conditions. Despite these advances, additional work is required in developing a practical system. Suggestions are made for combining advances in computer graphics and mathematical modeling.

APPLICATIONS OF PARALLEL PROCESSING IN FLUID MECHANICS; PROCEEDINGS OF THE APPLIED MECHANICS, BIOENGINEERING, AND FLUIDS ENGINEERING CONFERENCE, CINCINNATI, OH, JUNE 14-17, 1987

OKTAY BAYSAL, ED. (Old Dominion University, Norfolk, VA) Conference sponsored by ASME. New York, American Society of Mechanical Engineers, 1987, 97 p. For individual items see A88-14102 to A88-14110.

Recent advances in methods, algorithms, and applications of parallel processing in fluid mechanics are discussed in reviews and reports. Topics addressed include vectorizable implicit algorithms for the flux-difference split three-dimensional Navier-Stokes equations, microtasking of fluid-mechanics codes on an XM-P supercomputer, and supercomputing of supersonic

flows using upwind relaxation and MacCormack schemes. Consideration is given to the accuracy, geometrical flexibility, and vectorizability of the finite-difference method; a parallel compressible-flow algorithm for multiprocessors; performance of a three-dimensional Navier-Stokes code for high-speed juncture flows; computation of subsonic base flow on a vector processor; and multitasking for flows around multibody configurations using a chimera grid scheme. T.K.

A88-14103*# Vigyan Research Associates, Inc., Hampton, Va. **VECTORIZABLE IMPLICIT ALGORITHMS FOR THE FLUX-DIFFERENCE SPLIT, THREE-DIMENSIONAL NAVIER-STOKES EQUATIONS**

P. M. HARTWICH (Vigyan Research Associates, Inc., Hampton, VA), C.-H. HSU (Kansas University, Lawrence), and C. H. LIU (NASA, Langley Research Center, Hampton, VA) IN: Applications of parallel processing in fluid mechanics; Proceedings of the Applied Mechanics, Bioengineering, and Fluids Engineering Conference, Cincinnati, OH, June 14-17, 1987. New York, American Society of Mechanical Engineers, 1987, p. 9-18. refs (Contract NAS1-17919; NAG1-455)

The computational efficiency of four vectorizable implicit algorithms is assessed when applied to calculate steady-state solutions to the three-dimensional, incompressible Navier-Stokes equations in general coordinates. Two of these algorithms are characterized as hybrid schemes; that is, they combine some approximate factorization in two coordinate directions with relaxation in the remaining spatial direction. The other two algorithms utilize an approximate factorization approach which yields two-factor algorithms for three-dimensional systems. All four algorithms are implemented in identical high-resolution upwind schemes for the flux-difference split Navier-Stokes equations. These highly nonlinear schemes are obtained by extending an implicit Total Variation Diminishing (TVD) scheme recently developed for linear one-dimensional systems of hyperbolic conservation laws to the three-dimensional Navier-Stokes equations. The computation of vortical flow over a sharp-edged, thin delta wing has been chosen as a common numerical test case. The convergence of the algorithms is discussed and the accuracy of the computed flow-field results is assessed. The validity of the present results are demonstrated by a comparison with experimental data. Author

A88-14255# **USING MICROCOMPUTERS AND SPECIALIZED SOFTWARE TO ENHANCE AIRCRAFT DESIGN EDUCATION**

ROBERT F. DAVEY (California State Polytechnic University, Pomona) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 7 p. (AIAA PAPER 87-2866)

A new educational technique is described which provide the undergraduate engineering student with realistic design experiences while maintaining a clear link with the associated engineering principles. Using specially developed software and microcomputers, the method develops in the student the ability to evaluate the validity of computer-generated designs and performance predictions. Criteria are established for the required software and its usage and the results of a test case are reported. The application described uses special airfoil-analysis software for a series of design exercises which culminate in a requirement to establish performance goals and then develop an airfoil to meet them. After completing the assignments, the students' ability to relate the physical features of an airfoil shape to the predicted performance is clearly superior to that of students instructed using more traditional methods. PROJECT MANAGEMENT ISSUES AND LESSONS LEARNED FROM COMPUTER AIDED DESIGN APPLICATIONS

J. J. DAUES (McDonnell Douglas Corp., Saint Louis, MO) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 6 p. (AIAA PAPER 87-2912)

An account is given of the development status and prospective capabilities of proprietary computer graphics programs for future automated factories, with attention to social/organizational, technology assessment, and human resource issues. Critical factors in the performance of these graphics programs are identified as the maximization of personnel colocation, the definition of manufacturing approaches, and the exclusive use of three-dimensional coordination, with emphasis on the maximization of three-dimensional outputs. Computer graphics projection rooms for design reviews should be provided. O.C.

A88-14271*# National Aeronautics and Space Administration. **DESIGN AND VALIDATION OF FAULT-TOLERANT FLIGHT SYSTEMS**

GEORGE B. FINELLI and DANIEL L. PALUMBO (NASA, Langley Research Center, Hampton, VA) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 8 p. refs (AIAA PAPER 87-2923)

NASA has undertaken the development of a methodology for the design of easily validated fault-tolerant systems which emphasizes validation processes that can be directly incorporated into the design process. Attention is presently given to the statistical issues arising in the validation of highly reliable fault-tolerant systems. Structured specification and design methodologies, mathematical proof techniques, analytical modeling, simulation/emulation, and physical testing, are all discussed. Important design factors associated with fault-tolerance are noted; synchronization and 'Byzantine resilience' must accompany fault tolerance. O.C.

FUTURE DIRECTIONS IN L(INFINITY) ROBUST CONTROL THEORY

MICHAEL G. SAFONOV (Southern California, University, Los Angeles, CA) IN: IEEE Conference on Decision and Control, 25th, Athens, Greece, Dec. 10-12, 1986, Proceedings. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1986, p. 375-378. refs

This paper presents a perspective on the L(infinity)/conic-sector/singular-value theory for robust control system analysis and design. Included is a brief survey of the state-of-the-art and its shortcomings. The paper discusses some of the ongoing efforts to resolve the shortcomings and expand the scope of applicability of the L(infinity) theory, including the using of conformal mappings and diagonal scalings to reduce the conservativeness of L(infinity) synthesis, the needs for nonconic robustness analysis/synthesis, robust adaptive control, decentralized robust design and control, etc. Author

MATERIALS AND MANUFACTURING IN AEROSPACE

A. CLEMENTSON (British Aerospace, PLC, London, England) Aerospace Dynamics (ISSN 0263-2012), no. 22, 1987, p. 2-6.

The history of materials intended for aerospace applications and the fabrication techniques of these materials is reviewed, with emphasis on the advantages and limitations of carbon fiber composites (CFC). Numerically controlled NC integral machining methods and sheet manufacturing methods are considered. SPF/DB processing with Ti-6Al-4V has yielded cost and weight savings and the production of components with close geometrical consistency. Aluminum lithium alloys have achieved density savings of 10 percent and elastic modulus increases of 10 percent. Other topics considered include the advantages of suppliers, users, and supporting groups working together, recent changes in the organizational boundaries between the technical and production activities related to these materials, and synergistic effects amongst the general production systems concepts. R.R.

A88-16685

THE FUTURE OF FLIGHT SIMULATION

STEVE SEIDENSTICKER (Logicon, Inc., San Diego, CA) IN: International Conference on Simulators, 2nd, Coventry, England, Sept. 7-11, 1986, Proceedings. London, Institution of Electrical Engineers, 1986, p. 133-137.

Some of the requirements and challenges that face the flight simulation industry are explored and the application of various technical developments to future simulators is described. An underlying architecture, based on a high capacity local area network that will function as a universal interface between all major components of a flight simulator is presented. An extension of this interface will link whole simulators. The USAF Modularity Program, designed to establish basic architectures and standards for advanced simulator design, is described. K.K.

APPLICATIONS OF THE HYBRID AUTOMATED RELIABILITY PREDICTOR

SALVATORE J. BAVUSO, JOANNE BECHTA DUGAN, KISHOR T. TRIVEDI, BETH ROTHMANN, and MARK BOYD (Duke Univ., Durham, N. C.) 1987 31 p
(NASA-TP-2760; L-16304; NAS 1.60:2760) Avail: NTIS HC A03/MF A01 CSCL 12A

The Hybrid Automated Reliability Predictor (HARP) is a software package that implements advanced reliability modeling techniques. An overview is presented of some of the problems that arise in modeling highly reliable fault-tolerant systems, loosely divided into model construction and model solution problems. Then described is the HARP approach to these difficulties, which is facilitated by a technique called behavioral decomposition. The bulk of the paper presents examples of the evaluation of some typical fault tolerant systems, including a local area network, two fault-tolerant computer systems (Carnegie-Mellon University multiprocessor system C.mmp,

and Software Implemented Fault Tolerance (SIFT)), and two examples of flight control systems. Author

NCSU CODE: VALIDATION AND EXTENSION ON NAL'S UNIVAC 1100/60 SYSTEM

P. RAMAMOORTHY and K. DHANALAKSHMI May 1987 28 p
(PD-FM-8716) Avail: NTIS HC A03/MF A01

An existing computer program for obtaining the pressures on an airfoil (called here NCSU CODE) is validated on the UNIVAC 1100/60 at Canada's National Aeronautical Laboratory. A graphic routine to plot the results is added to the program to enhance its utility. The code is tried on a large number of airfoils including the modern general aviation and natural laminar airfoils. Results agree quite well with experiment; one should realize, however, that such a comparison is between the calculation in a free jet with experiments in tunnels of different blockage ratios and free stream turbulence. CGI DELAY COMPENSATION

RICHARD E. MCFARLAND Jan. 1986 30 p Previously announced in IAA as A86-37194
(NASA-TM-86703; REPT-85168; NAS 1.15:86703) Avail: NTIS HC A03/MF A01 CSCL 09B

Computer-generated graphics in real-time helicopter simulation produces objectionable scene-presentation time delays. In the flight simulation laboratory at Ames Research Center, it has been determined that these delays have an adverse influence on pilot performance during aggressive tasks such as nap-of-the-earth (NOE) maneuvers. Using contemporary equipment, computer-generated image (CGI) time delays are an unavoidable consequence of the operations required for scene generation. However, providing that magnitude distortions at higher frequencies are tolerable, delay compensation is possible over a restricted frequency range. This range, assumed to have an upper limit of perhaps 10 or 15 rad/sec, conforms approximately to the bandwidth associated with helicopter handling qualities research. A compensation algorithm is introduced here and evaluated in terms of tradeoffs in frequency responses. The algorithm has a discrete basis and accommodates both a large, constant transport delay interval and a periodic delay interval, as associated with asynchronous operations. Author

THE ACTIVE MINIMIZATION OF HARMONIC ENCLOSED SOUND FIELDS. I - THEORY. II - A COMPUTER SIMULATION. III - EXPERIMENTAL VERIFICATION

P. A. NELSON, A. R. D. CURTIS, S. J. ELLIOTT, and A. J. BULLMORE (Southampton, University, England) *Journal of Sound and Vibration* (ISSN 0022-460X), vol. 117, Aug. 22, 1987, p. 1-13, 15-33, 35-58. Research supported by the Ministry of Trade and Industry and SERC. refs

The suppression of internal sound fields by secondary sound sources is investigated theoretically and experimentally. The case of a lightly damped enclosure excited by a primary point source at a frequency above the Schroeder cutoff is considered. It is shown analytically that E_p (the total time-averaged acoustical potential energy of the secondary sources) can be significantly reduced if the secondary sources are no more than half a wavelength from the point source. In numerical simulations, E_p reductions are obtained by minimizing the pressure at the maximum of the primary field or at the corners of the enclosure (for responses dominated by one mode or by two or three modes, respectively). The results of experiments with a very shallow enclosure are found to be in good general agreement with the simulations. Large reductions are obtained only when the enclosure is excited on resonance. These findings are applicable to cabin noise reduction in advanced propeller/propfan-driven midrange passenger aircraft.

A SIMPLE PROCEDURE FOR TRACKING FAST MANEUVERING AIRCRAFT USING SPATIALLY DISTRIBUTED ACOUSTIC SENSORS

F. M. DOMMERMUTH (Forschungsgesellschaft fuer Angewandte Naturwissenschaften, Forschungsinstitut fuer Hochfrequenzphysik, Wachtberg-Werthhoven, Federal Republic of Germany) *Acoustical Society of America, Journal* (ISSN 0001-4966), vol. 82, Oct. 1987, p. 1418-1424. refs

Acoustical tracking of maneuvering aircraft based on bearing measurements from distributed sensors is not directly accessible to conventional techniques because of the retardation between emission and reception of sound. To overcome this complication, the following two-step strategy is proposed: (1) Estimate the aircraft location at an arbitrary time and repeat this procedure to obtain a sequence of position estimates; (2) combine these estimates by conventional filtering methods. Focusing on the first step, the localization problem is treated on the basis of at least two separated sensors that measure the direction of arrival of the incident sound wave. An assessment of the accuracy of the resulting position estimates is provided, as well. The procedure is illustrated both with simulated and real data.

NOISE CHARACTERISTICS OF MODEL COUNTER-ROTATING PROP-FANS

B. MAGLIOZZI (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT) *AIAA, Aeroacoustics Conference*, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 14 p. refs

(Contract NAS3-24222)

(AIAA PAPER 87-2656)

Results of acoustics tests of 24.5 in. diameter model counter-rotating propfans are presented. In these tests several configurations were investigated, including tractors and pushers downstream of a pylon, both at zero degrees and at four degrees

angle-of-attack. The effects on noise of spacing between rotors and between the pylon and the rotors were also measured. Effects of rotor spacing were found to cause small changes in noise. Increasing blade count from 5-front and 5-rear to 6-front and 6-rear results in about a 1 EPNdB reduction in noise. Increasing only the front rotor blade count to six blades resulted in a noise reduction of about 2 EPNdB. The presence of the pylon resulted in a 1 EPNdB increase in noise. Angle of attack effects showed an increase of 3.5 EPNdB for the tractor configuration and only 1.5 EPNdB for the pusher configuration. Tip speed was found to be the strongest parameter in reducing noise. However, for a given thrust loading, an optimum tip speed is seen. Correlations between measurements and predictions are shown to be in good agreement.

NOISE PREDICTION OF COUNTER ROTATION PROPELLER

T. WATANABE, K. KAWACHI (Tokyo, University, Japan), and Y. NAKAMURA (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan) *AIAA, Aeroacoustics Conference*, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 8 p. refs

(AIAA PAPER 87-2658)

An analytical study has been conducted in order to make clear the sensitivity of the various design parameters to the sound pressure level. The airloading is calculated by using the newly extended Local Circulation Method. By using the calculated distribution of the airloading as the noise source term, the acoustic field is calculated by integrating it at the retarded time. The results quantitatively indicates that the wake caused by the profile drag of the front rotor becomes the appreciable noise source especially when the distance between the front and rear rotors is small. The wake from the pylon also causes the additional noise, which has the strong azimuthal directivity. The angle of attack of the aircraft leads to increased noise level, which is sensitive to the observer position just under the aircraft. Finally, the sensitivity of the rotor-rotor spacing to the noise level is presented.

ACOUSTIC TRANSMISSIBILITY OF ADVANCED TURBOPROP AIRCRAFT WINDOWS

FERDINAND W. GROSVELD (NASA, Langley Research Center; Bionetics Corp., Hampton, VA) *AIAA, Aeroacoustics Conference*, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 12 p. refs

(Contract NAS1-16978)

(AIAA PAPER 87-2662)

Advanced turboprop technology allows propeller aircraft to reach cruise speeds comparable to current jet aircraft yet with considerable fuel savings. Due to the higher blade loading and higher tip speed of these propellers, noise levels of up to 150 dB are expected on the outside of the fuselage in the propeller plane. In this study the transmissibility of triple pane windows, designed to provide 69 dB noise transmission loss at the blade propeller frequency of 164 Hz, was experimentally investigated using insertion loss and three-dimensional intensity techniques. A modal analysis on the outer window panes was conducted to determine pane modal frequencies. Coherence and phase relation of outer panes and window frame were established to obtain double/triple wall and lump mass resonance frequencies. Double/triple wall resonances were found to degrade the transmission loss of the two windows. It was shown that, at the blade passage frequency and the first two overtones, the combinations of window plus scratch shield provide less transmission loss than the average transmission loss of the treated fuselage. Strong disagreement was obtained between the experimental transmission loss of this investigation and the theoretical predictions from another study.

ROGER S. GATES, CARROLL B. BUTLER (USAF, Armament Laboratory, Eglin AFB, FL), LEONARD L. SHAW (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH), and RICHARD E. DIX (Calspan Corp., Technology and Analysis Branch, Arnold Air Force Station, TN) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p.
(AIAA PAPER 87-2667)

In order to study the effects of unsteady (dynamic) and steady (static) pressure waves in a cavity at subsonic Mach numbers through transonic Mach numbers, an experimental test program, using a splitter plate and a generic cavity, was conducted. Since most cavities associated with air vehicles house sensors, equipment, or armament, ogive cylinder models were also fabricated and tested inside the cavity to determine their effect on the static and dynamic pressure measurements on the cavity ceiling and walls. The intent of the experiment was to document the effects on steady and unsteady pressures by varying parameters such as the Mach number, cavity dimensions, blockage, and cavity angle of attack. These results will provide engineers with a technology base to aid in the formulation of design requirements and preliminary designs for future air vehicles requiring external cavities. Author

A88-16536#**NUMERICAL SIMULATION OF AERODYNAMIC SOUND RADIATION FROM TWO-DIMENSIONAL WING**

SADAO AKISHITA (Mitsubishi Electric Corp., Amagasaki, Japan), KUNIO KUWAHARA, and YOSHIFUMI SHIDA (Tokyo, University, Japan) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 7 p. refs
(AIAA PAPER 87-2672)

This paper describes numerical simulation of random noise radiation from a two-dimensional wing immersed in low subsonic flow. The first model of the flows is a perfectly separated flow around a thin flat plate. A discrete vortex simulation is applied to the flow. The second model is the turbulent boundary layer around a typical airfoil. The high-precision finite-difference method is applied to the latter model. The sound radiation field is calculated from the pressure distribution on the wing surface for both cases. The computed results are compared rather successfully with the experimental data. Author

A88-16537#**A SPECTRAL METHOD FOR THE COMPUTATION OF PROPELLER ACOUSTICS**

J. B. H. M. SCHULTEN (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 12 p. Research sponsored by the Nederlands Instituut voor Vliegtuigontwikkeling en Ruimtevaart. refs
(AIAA PAPER 87-2674)

In the present study an analytical description of the acoustic field of a propeller in a uniform flow is derived. Instead of applying the usual Ffowcs Williams-Hawkings (1969) version of the acoustic analogy, sources on a surface enclosing the propeller and its adjacent nonlinear flow field are formulated. This approach, which avoids the laborious evaluation of quadrupole source terms, is to be considered as a generalization of the Kirchhoff-Helmholtz theorem of acoustics. By describing the fundamental solution as a spectral Fourier-Bessel decomposition, the resulting sound field is readily given in the appropriate series of harmonic amplitudes. The method is validated by a comparison of numerical results with experimental data of a propeller in an acoustic wind tunnel. A good agreement, both in amplitude and phase, is found between theory and experiment. Author

RIMAS VAICAITIS (Columbia University, New York) and CONSTANTINOS S. LYRINTZIS (San Diego State University, CA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 8 p. refs
(Contract NAG1-541)
(AIAA PAPER 87-2679)

The structure-borne noise transmission of stiffened and interconnected structures under random loads is presented. The method is based on the transfer matrix for the structural response and on the modal decomposition for the interior acoustic field. The acoustic enclosure is taken to be rectangular in shape of which portion of the boundaries are elastic while the remaining surface is acoustically rigid. Numerical results are presented for several acousto-structural problems. Author

A88-16541*# Southwest Research Inst., San Antonio, Tex.**STRUCTURE-BORNE NOISE CONTROL FOR PROPELLER AIRCRAFT**

JAMES F. UNRUH (Southwest Research Institute, San Antonio, TX) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 8 p. refs
(Contract NAS1-17921)
(AIAA PAPER 87-2680)

A laboratory test apparatus was developed which would allow the study and development of propeller wake/vortex-induced structure-borne interior noise control measures. Various methods of wing structural modification, including blocking masses, surface damping treatments, and tuned mechanical absorbers, were evaluated relative to reduced interior noise levels. Inboard wing fuel was found to act as an effective blocking mass. Wing panel add-on damping treatment in the form of a single, constrained layer was not an effective control measure, except in the area of the propeller wake. However, highly damped, tuned mechanical absorbers were found to be the most efficient structure-borne noise (SBN) control measure. Author

A88-16548#**NOZZLE GEOMETRY EFFECTS ON SUPERSONIC JET INTERACTION**

R. W. WLEZIEN (McDonnell Douglas Research Laboratories, Saint Louis, MO) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. refs
(AIAA PAPER 87-2694)

The coupled interaction of jets from two nominally identical convergent/divergent nozzles is examined as a function of nozzle spacing. The screech modes of two coupled jets correspond to those observed for single plumes, but the modal amplitudes are strongly dependent on nozzle spacing. For closely-spaced nozzles, coupling occurs at low jet Mach numbers and is suppressed at high Mach numbers. The converse is true for large spacing. The amplitude of the coupled jets is independent of the nozzle design Mach number, unlike the screech amplitudes of isolated plumes, which decrease near the design point. Interference between the plumes and the relative phasing of the acoustic sources are proposed as mechanisms for the geometry dependence of the jet coupling. Author

A88-16550*# Florida State Univ., Tallahassee.**ANALYSIS OF TWIN SUPERSONIC PLUME RESONANCE**

CHRISTOPHER K. W. TAM (Florida State University, Tallahassee) and J. M. SEINER (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 11 p. refs
(Contract NAG1-421)
(AIAA PAPER 87-2695)

Recent experiments conducted at NASA Langley show that twin supersonic jets separating by a distance of approximately two nozzle diameters (center to center) exhibit resonant oscillations under a wide range of operating conditions. In this paper the mechanism responsible for the synchronized resonant oscillations

is investigated. A vortex sheet jet model is used in the analysis. The model shows that kinematically two modes of twin jet resonance can occur. One mode involves flapping motion of both jets symmetric with respect to the mid-plane separating the two jets. The other mode involves antisymmetric flapping motion. The symmetric mode is consistent with experimental observations. The vortex sheet jet model is, however, unable to provide quantitative estimates of the shift in screech frequency (as compared to a single jet) due to the resonance phenomenon. The reason for this is discussed. Possible improvement of the model and directions for future work are indicated. Author

A88-16551#**A REFLECTION MECHANISM FOR AFT FAN TONE NOISE FROM TURBOFAN ENGINES**

D. A. TOPOL, S. C. HOLHUBNER, and D. C. MATHEWS (Pratt and Whitney, East Hartford, CT) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 8 p. refs (AIAA PAPER 87-2699)

A fan tone noise mechanism is proposed which results from reflections from the fan of forward propagating rotor wake/fan exit guide vane interaction tone noise. These fan noise tones are often more dominant out of the rear than out of the front of an engine. To simulate this effect a simple qualitative prediction model was formulated and a scaled model test program was conducted. Results from each of these investigations are compared with each other and with full-scale engine data. These comparisons substantiate the potential importance of this mechanism. Further support is provided by mode measurement data from full-scale testing. This study concluded that for certain vane/blade ratios and tip Mach numbers the contribution of the reflection noise mechanism is significant. Author

A88-16552#**DETECTION OF FAN ACOUSTIC MODE**

YOSHIYA NAKAMURA and KOUSUKE ISOMURA (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 12 p. refs (AIAA PAPER 87-2700)

The devices to detect fan acoustic mode, both in the duct and in the radiated field were developed, and their capability to define noise source was demonstrated. The acoustic mode of double stream test fan was investigated using these devices, originally intended to study the relation between outlet guide vane/strut configuration, such as vane number or cyclic staggering. However, it was shown that the inlet disturbance due to inflow control device frame caused the interaction noise with fan blade, which masked the fan original noise. Author

A88-16553#**DUCTED FAN NOISE PROPAGATION IN NON-UNIFORM FLOW. I - TEST BACKGROUND AND SIMPLIFIED MODEL**

T. G. SOFRIN and D. E. CICON (Pratt and Whitney, East Hartford, CT) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 12 p. refs (AIAA PAPER 87-2701)

Several examples are given of anomalous fan noise modal spectra, determined from in-duct array measurements. These consistent distorted spectra led to an investigation into their origin, which came to focus upon non-uniform axial flow as a common basic cause. Supporting data and the results of a simplified analytic treatment led to a procedure for predicting the effects of flow non-uniformity and to a method for reducing its influence in estimating the dominant sources of fan noise from array measurements. Author

ACTIVE CONTROL OF SOUND FIELDS IN ELASTIC CYLINDERS BY MULTI-CONTROL FORCES

J. D. JONES (Purdue University, West Lafayette, IN) and C. R. FULLER (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. refs (Contract NAG1-390) (AIAA PAPER 87-2707)

An unstiffened cylindrical model was used to study the control of sound transmission into aircraft cabins by the use of multi-control forces applied directly to the cylinder wall. External acoustic monopoles were located on each side of the cylinder to approximate the propeller noise source. This allowed the study of a dual control system utilizing multi-control forces in conjunction with synchrophasing of the twin acoustic monopole sources. For acoustic resonant conditions within the cavity, a spatially averaged noise reduction of approximately 30 dB was achieved using the active control system for both in-phase and out-of-phase monopoles; however, effective reduction of the sound field was dependent upon judiciously positioning the control forces for optimal control of the sound field. Author

A88-16563#**AN EXPERIMENTAL INVESTIGATION OF THE COHERENT STRUCTURE IN AN INCOMPRESSIBLE JET**

GERALD L. MORRISON, GARY B. TATTERSON (Texas A & M University, College Station), and SAIED EMAMI AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. refs (AIAA PAPER 87-2715)

An experimental investigation of an incompressible Mach 0.15 free jet under the influence of acoustic disturbances at a Strouhal number of 0.50 was performed in order to determine the overall turbulence characteristics and the contributions of the coherent structure to the turbulent flow field. Maximum turbulence levels of 12 percent for the axial and 11 percent for the radial turbulence intensities were found based upon the jet exit velocity. The axial and radial ensemble averaged turbulence intensities were shown to be maximized before the end of the potential core and to decay rapidly past the end of the potential core. Reynolds stress contours and mean velocity distributions were also obtained, yielding the contours of the kinematic eddy viscosity. R.R.

A88-16564#**MEASUREMENT ON ACOUSTIC SOURCE-STRENGTH DISTRIBUTION OF COAXIAL JETS**

Y. NAKAZONO (Kyushu Tokai University, Kumamoto, Japan) and S. KOTAKE (Tokyo, University, Japan) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 7 p. refs (AIAA PAPER 87-2716)

The distribution of acoustic source strength in coaxial jets has been studied experimentally by the reflector-mirror microphone method. The acoustic sources are most intensively distributed in the mixing regions between the inner and outer jets. The source strength in this region is greatly dominated by the relative velocity of the inner and outer jets, taking the minimum at the velocity ratio of about 0.5. The area ratio and the relative position of the nozzles are changed to study their effects on the source distribution. Increase in the area ratio shifts the acoustic source downstream in the outer jet without any change in the inner jet. Extending the inner jet nozzle moves the noise source in the inner jet to the downstream without any change of the outer jet, while extending the outer nozzle shifts wholly the noise source distribution downstream. CRUISE NOISE OF THE 2/9 SCALE MODEL OF THE LARGE-SCALE ADVANCED PROPPAN (LAP) PROPELLER, SR-7A

JAMES H. DITTMAR (NASA, Lewis Research Center, Cleveland, OH) and DAVID B. STANG (NASA, Lewis Research Center; Sverdrup Technology, Inc., Cleveland, OH) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 18 p. Previously announced in STAR as N87-28398. refs (AIAA PAPER 87-2717)

Noise data on the Large-scale Advanced Propfan (LAP) propeller model SR-7A were taken in the NASA Lewis Research Center 8 x 6 foot Wind Tunnel. The maximum blade passing tone noise first rises with increasing helical tip Mach number to a peak level, then remains the same or decreases from its peak level when going to higher helical tip Mach numbers. This trend was observed for operation at both constant advance ratio and approximately equal thrust. This noise reduction or, leveling out at high helical tip Mach numbers, points to the use of higher propeller tip speeds as a possible method to limit airplane cabin noise while maintaining high flight speed and efficiency. Projections of the tunnel model data are made to the full scale LAP propeller mounted on the test bed aircraft and compared with predictions. The prediction method is found to be somewhat conservative in that it slightly overpredicts the projected model data at the peak.

ADDED NOISE DUE TO THE EFFECT OF AN UPSTREAM WAKE ON A PROPELLER

M. A. TAKALLU, P. L. SPENCE (PRC Kentron, Inc., Hampton, VA), and P. J. W. BLOCK (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. refs (AIAA PAPER 87-2720)

An analytical/computational study has been conducted to predict the effect of an upstream wing or pylon on the noise of an operating propeller. The wing trailing edge was placed at variable distances (0.1 and 0.3 chord) upstream of a scaled model propeller (SR-2). The wake was modeled using a similarity formulation. The instantaneous pressure distribution on the propeller blades during the passage through the wake was formulated in terms of a time-dependent variation of each blade section's angle of attack and in terms of the shed vortices from the blade trailing edge. It was found that the final expressions for the unsteady loads considerably altered the radiated noise pattern. Predicted noise for various observer positions, rotational speeds, and propeller/pylon distances were computed and are presented in terms of the pressure time history, harmonics of the Fourier analysis, and overall sound pressure levels (OASPL). The addition of the tangential stress due to skin friction was found to have a damping effect on the acoustic pressure time history and the resulting spectrum of the generated noise. It is shown that the positioning of a pylon upstream of a propeller indeed increases the overall noise.

FLOW-INDUCED NOISE FROM WIND TUNNEL TURBULENCE REDUCTION SCREENS

RICHARD M. ALLEN, RICHARD R. GIBBS (Boeing Commercial Airplane Co., Seattle, WA), and PATRICK J. F. CLARK (DSMA International, Inc., Toronto, Canada) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 6 p. refs (AIAA PAPER 87-2728)

Boeing is acquiring a new Low Speed Aeroacoustic Facility to simulate low speed flight conditions by adding a free jet to an existing anechoic chamber. The primary facility characteristics will be high flow quality and low background noise levels in the open jet test section. During the design phase, it was recognized that noise generated by flow through the turbulence reduction screens could intrude on the test section noise floor. Since no published information could be found on flow noise in screens, experiments

were conducted to measure flow noise for a wide variety of screen sizes and airflow velocities. Data analysis, using multiple regression, produced a screen noise prediction equation for overall sound power as a function of flow velocity, screen wire diameter, number of screens, and screen cross-sectional area. This prediction should be useful for wind tunnel design when low test section sound levels are required.

A STUDY OF SOME FACTORS AFFECTING THE AEROACOUSTIC PERFORMANCE OF A DUCTED CONTRA-ROTATING AXIAL FLOW FAN STAGE

P. B. SHARMA, D. S. PUNDHIR, and K. K. CHAUDHRY (Indian Institute of Technology, New Dehli, India) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 8 p. Research supported by the Aero Research and Development Board of India. refs

(AIAA PAPER 87-2730)

The paper reports the results of an experimental investigation into the aeroacoustic performance of a ducted contra-rotating axial flow fan stage having a hub-tip ratio of 0.66. Aerodynamic superiority of a contra-stage is examined from the point of view of higher pressure rise, increased through flow and rotating stall suppression. Measurements of sound pressure levels and real time analysis of the noise signals is reported for different speed combinations for clean and distorted inlet flow for two axial gaps between the contra-rotors. The effect of pitch chord ratio and axial gap between the rotors on the aeroacoustic performance is discussed. The study reveals that the axial gap between the rotors significantly affects the aeroacoustic performance of a contra-fan stage.

AEROACOUSTICS OF SUBSONIC TURBULENT SHEAR FLOWS

MARVIN E. GOLDSTEIN (NASA, Lewis Research Center, Cleveland, OH) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. Previously announced in STAR as N87-26615. refs

(AIAA PAPER 87-2731)

Sound generation in turbulent shear flows is examined. The emphasis is on simultaneous calculation of the turbulent flow along with the resulting sound generation rather than the alternative acoustic analogy approach. The first part of the paper is concerned with solid surface interaction. The second part concentrates on the sound generated by turbulence interacting with itself.

ACOUSTIC AND AERODYNAMIC CHARACTERISTICS OF PERFOLIN, THE LINEAR PERFORATED PLATE ACOUSTIC LINER

T. ZANDBERGEN (Nationaal Lucht- en Ruimtevaartlaboratorium, Emmeloord, Netherlands) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 14 p. refs (AIAA PAPER 87-2740)

Test results on a linear perforated acoustic liner material named Perfolin, consisting of a honeycomb structure with a microporous facing sheet containing horn shaped orifices, are presented. The impedance of the Perfolin liners is shown to have low sensitivity to flow and sound pressure level. Its surface is aerodynamically smooth, and its low mass reactance gives it a broad frequency band of absorption. The acoustic resistance of Perfolin is found to be independent of frequency. Further improvement of Perfolin face sheet properties should be possible by promoting laminar viscous dissipation while reducing the generation of vorticity and separation areas.

A MODEL OF THE WALL BOUNDARY LAYER FOR DUCTED PROPELLERS

WALTER EVERSMAN (Missouri-Rolla, University, Rolla) and WILLI MOEHRING (Max-Planck-Institut fuer Stroemungsforschung, Goettingen, Federal Republic of Germany) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. refs (Contract NAG3-178)
(AIAA PAPER 87-2742)

The objective of the present study is to include a representation of a wall boundary layer in an existing finite element model of the propeller in the wind tunnel environment. The major consideration is that the new formulation should introduce only modest alterations in the numerical model and should still be capable of producing economical predictions of the radiated acoustic field. This is accomplished by using a stepped approximation in which the velocity profile is piecewise constant in layers. In the limit of infinitesimally thin layers, the velocity profile of the stepped approximation coincides with that of the continuous profile. The approach described here could also be useful in modeling the boundary layer in other duct applications, particularly in the computation of the radiated acoustic field for sources contained in a duct. A SOURCE LOCALIZATION TECHNIQUE FOR HELICOPTER ROTOR NOISE

D. BLACODON, M. CAPLOT, and G. ELIAS (ONERA, Chatillon-sous-Bagneux, France) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 10 p. refs (AIAA PAPER 87-2743)

A multimicrophone array technique for the localization of helicopter rotor impulsive noise sources is developed and applied here to the acoustic radiation of blade-vortex interaction. To isolate correctly the phenomenon, the analysis is made in the time domain rather than in the frequency one. Two kinds of array processing are presented: a linear beam forming and a multiplicative processing. For the case of a simple source, both techniques give good results. But in the case of multiple-point sources, only the second processing is accurate; the linear beam forming cannot detect two sources which are closely spaced. Comparisons of computed simulations with an anechoic chamber experiment show a very good agreement. Finally, the multiplicative processing is applied to a helicopter rotor noise test in the CEPRA 19 anechoic wind tunnel. In this experiment, the rotor blades were equipped with blade pressure transducers which give the blade-vortex interaction loci. Comparison, for one interaction, between the array technique and the measured values presents a good agreement, when the flow effects (i.e., convection and refraction) are taken into account. Author

ROTOR BLADE-VORTEX INTERACTION IMPULSIVE NOISE SOURCE IDENTIFICATION AND CORRELATION WITH ROTOR WAKE PREDICTIONS

W. R. SPLETTSTOESSER, K. J. SCHULTZ (DFVLR, Brunswick, Federal Republic of Germany), and RUTH M. MARTIN (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 23 p. refs (AIAA PAPER 87-2744)

An acoustic source localization scheme applicable to noncompact moving sources is developed and applied to the blade-vortex interaction (BVI) noise data of a 40-percent scale BO-105 model rotor. A generalized rotor wake code is employed to predict possible VBI locations on the rotor disk and is found quite useful in interpreting the acoustic localization results. The highly varying directivity patterns of different BVI impulses generated at the same test condition are explained by both the localization results and predicted tip vortex trajectories. The effects of rotor tip-path-plane angle and advance ratio on the BVI source positions is studied. Decreasing tip-path-plane angle (at constant advance ratio) moves the general interaction region upwind on

the rotor disk, significantly changing the interaction geometry. Increasing advance ratio (at constant tip-path-plane angle) shifts the general source region downwind on the rotor disk with the increased convection of the vortices until about 60 deg azimuth, where the BVI sources appear to become acoustically less effective. The region of strongest BVI sources lies between 60 and 70 deg azimuth and 80 and 90 percent radius for the moderate range of advance ratios studied. Author

THE PREDICTION OF HELICOPTER TAIL ROTOR NOISE ON THE FLIGHT PATH

STEWART A. L. GLEGG (Florida Atlantic University, Boca Raton) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 7 p.
(Contract NAG1-715)
(AIAA PAPER 87-2747)

Experimental measurements on a model scale helicopter in a wind tunnel have shown that the levels radiated in the direction of flight are strongly dependent on the fuselage angle to the mean flow. Here a theoretical model is derived to explain these measurements using unsteady thickness noise as the principle source mechanism. The model includes the effect of fuselage wake turbulence which is convected through only the lower sector of the rotor disk. This causes spectral peaks which do not occur at blade passing frequencies, but rather at frequencies associated with convected flow inhomogeneities. The results are compared with measurements and show good agreement over a range of fuselage angles and mean flow speeds. Author

PREDICTION OF BLADE-VORTEX INTERACTION NOISE USING MEASURED BLADE PRESSURES

MAHENDRA C. JOSHI, SANDY R. LIU (Bell Helicopter Textron, Inc., Fort Worth, TX), and DONALD A. BOXWELL (U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA) AIAA, Aeroacoustics Conference, 11th, Sunnyvale, CA, Oct. 19-21, 1987. 11 p. refs
(Contract NAS1-17148)
(AIAA PAPER 87-2749)

In the study reported here, blade-vortex interaction noise was predicted using a simplified model of blade pressures measured on a one-seventh scale model AH-1/OLS main rotor. The methods used for the acoustic prediction are based on the acoustic analogy and have been developed by Nakamura (1981) and by Brentner, Nystrom, and Farassat (referred to as the WOPWOP method). The waveforms predicted by the two methods are in good agreement with each other and with the measurements in terms of the number of pulses, the pulse widths, and the separation times between the pulses. The peak amplitude of the dominant pulse may, however, be underpredicted by up to 40 percent, depending on flight conditions. Ways of improving the accuracy of the prediction methods are suggested. A HYBRID NUMERICAL TECHNIQUE FOR PREDICTING THE AERODYNAMIC AND ACOUSTIC FIELDS OF ADVANCED TURBOPROPS Final Report

G. F. HOMICZ and J. R. MOSELLE Apr. 1985 71 p
(Contract NAS3-23699)
(NASA-CR-174926; NAS 1.26:174926; CALSPAN-7157-A-1)
Avail: NTIS HC A04/MF A01 CSCL 20A

A hybrid numerical procedure is presented for the prediction of the aerodynamic and acoustic performance of advanced turboprops. A hybrid scheme is proposed which in principle leads to a consistent simultaneous prediction of both fields. In the inner flow a finite difference method, the Approximate-Factorization Alternating-Direction-Implicit (ADI) scheme, is used to solve the nonlinear Euler equations. In the outer flow the linearized acoustic equations are solved via a Boundary-Integral Equation (BIE) method. The two solutions are iteratively matched across a fictitious interface in the flow so as to maintain continuity. At convergence

the resulting aerodynamic load prediction will automatically satisfy the appropriate free-field boundary conditions at the edge of the finite difference grid, while the acoustic predictions will reflect the back-reaction of the radiated field on the magnitude of the loading source terms, as well as refractive effects in the inner flow. The equations and logic needed to match the two solutions are developed and the computer program implementing the procedure is described. Unfortunately, no converged solutions were obtained, due to unexpectedly large running times. The reasons for this are discussed and several means to alleviate the situation are suggested. Author

MEASUREMENT OF VELOCITY AND VORTICITY FIELDS IN THE WAKE OF AN AIRFOIL IN PERIODIC PITCHING MOTION

EARL R. BOOTH, JR. Dec. 1987 31 p
(NASA-TP-2780; L-16339; NAS 1.60:2780) Avail: NTIS HC A03/MF A01 CSCL 20A

The velocity field created by the wake of an airfoil undergoing a prescribed pitching motion was sampled using hot wire anemometry. Data analysis methods concerning resolution of velocity components from cross wire data, computation of vorticity from velocity time history data, and calculation of vortex circulation from vorticity field data are discussed. These data analysis methods are applied to a flow field relevant to a two dimensional blade-vortex interaction study. Velocity time history data were differentiated to yield vorticity field data which are used to characterize the wake of the pitching airfoil. Measurement of vortex strength in sinusoidal and nonsinusoidal wakes show vortices in the sinusoidal wake have stronger circulation and more concentrated vorticity distributions than the tailored nonsinusoidal wake. RESULTS OF THE 1986 NASA/FAA/DFVLR MAIN ROTOR TEST ENTRY IN THE GERMAN-DUTCH WIND TUNNEL (DNW)

THOMAS F. BROOKS and RUTH M. MARTIN Oct. 1987 24 p
(NASA-TM-100507; NAS 1.15:100507) Avail: NTIS HC A03/MF A01 CSCL 20A

An acoustics test of a 40%-scale MBB BO-105 helicopter main rotor was conducted in the Deutsch-Niederlandischer Windkanal (DNW). The research, directed by NASA Langley Research Center, concentrated on the generation and radiation of broadband noise and impulsive blade-vortex interaction (BVI) noise over ranges of pertinent rotor operational envelopes. Both the broadband and BVI experimental phases are reviewed, along with highlights of major technical results. For the broadband portion, significant advancement is the demonstration of the accuracy of prediction methods being developed for broadband self noise, due to boundary layer turbulence. Another key result is the discovery of rotor blade-wake interaction (BWI) as an important contributor to mid frequency noise. Also the DNW data are used to determine for full scale helicopters the relative importance of the different discrete and broadband noise sources. For the BVI test portion, a comprehensive data base documents the BVI impulsive noise character and directionality as functions of rotor flight conditions. The directional mapping of BVI noise emitted from the advancing side as well as the retreating side of the rotor constitutes a major advancement in the understanding of this dominant discrete mechanism. AIRCRAFT DESIGN EDUCATION AT THE ROYAL MILITARY COLLEGE OF SCIENCE SHRIVENHAM (CIT) AND KINGSTON POLYTECHNIC

RAY WHITFORD (Royal Military College of Science, Shrivenham, England) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 10 p. refs
(AIAA PAPER 87-2867)

This paper briefly outlines the layout of typical UK Aeronautical Engineering degree courses and shows how a group design project is used as an integrator of core-curriculum subjects. The objectives, organization and management of final year undergraduate group projects in aircraft design at two UK colleges are described. Emphasis is placed on achieving realism in the feasibility studies carried out by small teams with projects selected to reflect current or future needs for aircraft. Details of the design activities, industry/military participation, useful references and the benefits of CAD are discussed. Fifteen years' experience including a year spent at a U.S. university together with feedback from industry has shown the great value of such projects. Author

AIRCRAFT DESIGN EDUCATION IN CHILE

FERNANDO F. MUJICA (Academia Politecnica Aeronautica, Chile) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 8 p.
(AIAA PAPER 87-2869)

The only institute to graduate aeronautical engineers in Chile is the Academia Politecnica Aeronautica of the Chilean Air Force. A very important part of the six-year curriculum is the aircraft design project in the final year. In this paper, it is shown how the aeronautical engineer curriculum leads the students to the final project of Aircraft Design, which is a conceptual design of an aircraft that satisfies a current or future operational requirement of the Chilean Air Force. Finally, the general procedure of the aircraft design course is presented, and projects developed by the students during recent years are shown, including a basic training, an advanced training/attack, and a tactical transport aircraft. PROGRAM MANAGEMENT OF THE F-16 PROGRAM

F. A. CURTIS, JR. (General Dynamics Corp., Fort Worth, TX) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Meeting, Saint Louis, MO, Sept. 14-16, 1987. 12 p.
(AIAA PAPER 87-2962)

The program management team that conceived, designed, developed, and is producing (with multinational coproducers) the F-16 multirole combat fighter was established to effectively manage the system in the various program phases. The overall major program management challenge is to maintain quality, schedule, and low cost in the program environment of continually changing, simultaneous, major program phases: i.e. (1) multiple major configuration production deliveries, (2) maturation and upgrade of the operational fleet, and (3) evolutionary development and

17 SOCIAL SCIENCES

transition to high-rate production of new models. The scope and complexity of the challenge to the F-16 program management team plus key programmatic lessons learned are directly related to some of the call for paper topics related to technical management approaches/techniques. Keys to the success of the program and the management thereof are: (1) the effective Air Force, contractor, subcontractor, and coproducer team relationship, (2) a prime contractor management team tailored to the program, (3) timely/augmented feedback from the using commands, (4) attention to cost and supportability from the onset, (5) lack of major technical problems, and (6) continual enhancement of product integrity and combat capability for both new production and fleet retrofit. TRANSPORT AIRCRAFT SAFETY - AN AVIATION COMMUNITY COMMITMENT

RICHARD W. TAYLOR (Boeing Co., Seattle, WA) SAE, Aerospace Vehicle Conference, Washington, DC, June 8-10, 1987. 11 p. (SAE PAPER 871328)

The historical record is evaluated in a discussion of the extent to which product liability litigation detracts from, rather than enhances, the safe design and manufacture of transport aircraft. Product failure is noted to have been the cause of less than 18 percent of transport aircraft accidents. Attention is given to the goals of safe aircraft design, manufacture, operation, maintenance, and operating environments. Specific problems emerging in the current accident litigation system are discussed with a view to the formulation of a 'no-fault' accident claim system that can be instituted as a legislative solution to the contemporary impasse.

O.C.

A88-14361

THE IMPACT OF PRODUCT LIABILITY LITIGATION ON THE AVIATION COMMUNITY - A GENERAL AVIATION AIRCRAFT MANUFACTURER'S VIEW

MAX E. BLECK and BRUCE E. PETERMAN (Cessna Aircraft Co., Wichita, KS) SAE, Aerospace Vehicle Conference, Washington, DC, June 8-10, 1987. 8 p. (SAE PAPER 871329)

The General Aviation Manufacturers Association is a major proponent of legislation to reform current tort law procedures concerning general aviation product liability, which vary from state to state; the aim of these efforts is to replace such state liability statutes with a uniform federal standard for manufacturers. The present discussion contrasts manufacturers' emphasis of safety practices in view of FAA regulations and the general declining trend for fatal aircraft accidents, on the one hand, with the impact of product liability litigation, on the other.

O.C.

A88-14362

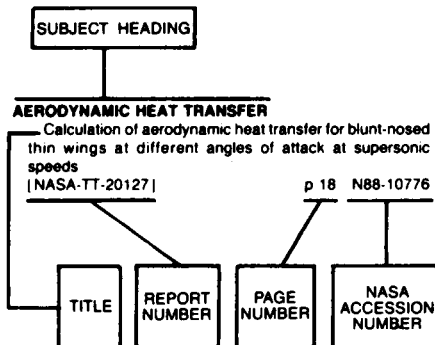

THE IMPACT OF PRODUCT LIABILITY ON AVIATION DEVELOPMENT

FREDERICK B. SONTAG (General Aviation Manufacturer's Association, Inc., Washington, DC; Unison Industries, Inc., Rockford, IL) SAE, Aerospace Vehicle Conference, Washington, DC, June 8-10, 1987. 6 p. (SAE PAPER 871330)

The recent history of product liability is noted to have been characterized by legal maneuvers aimed solely at the establishment of a source for the paying of damages, irrespective of true fault. These maneuvers threaten to curtail the important element of innovation in aviation development. The situation is frequently so aggravated that a number of manufacturers have either foregone liability insurance because of its excessive cost or been unable to find coverage at any price. A number of companies have lost valuable sources of component supply due to their fear of involvement in product liability proceedings.

O.C.

Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of document content, a title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

AERODYNAMIC COEFFICIENTS

Aerodynamic analysis of complicated three-dimensional configurations using surface panel methods

[NASA-CR-13266] p 68 A88-13266

An experimental evaluation of advanced rotorcraft airfoils in the NASA Ames eleven-foot transonic wind tunnel

[NASA-CR-166587] p 79 N88-11640

Improvements to the adaptive maneuvering logic program

[NASA-CR-3985] p 93 N88-11648

Semiempirical method for prediction of aerodynamic forces and moments on a steadily spinning light airplane

[NASA-TM-4009] p 80 N88-12456

Aerodynamic sensitivities from subsonic, sonic and supersonic unsteady, nonplanar lifting-surface theory

[NASA-TM-100502] p 80 N88-12459

AERODYNAMIC CONFIGURATIONS

Experimental studies on canard configurations

[NASA-CR-13433] p 69 A88-13433

A method to optimize nacelle shape in a supersonic cruise aircraft

[AIAA PAPER 87-2865] p 89 A88-14254

Aerodynamic integration of aft-mounted UHB propulsion systems — Ultra High Bypass

[AIAA PAPER 87-2920] p 89 A88-14269

An experimental investigation of wing/fuselage integration geometries

[AIAA PAPER 87-2937] p 74 A88-14278

An aerodynamic performance evaluation of the NASA/Ames Research Center advanced concepts flight simulator

[NASA-TM-89659] p 107 N88-11685

AERODYNAMIC DRAG

Zero-lift drag predictions in supersonic flow for complex configurations

[NASA-TM-4009] p 71 A88-14021

Planform effects on the supersonic aerodynamics of multibody configurations

[NASA-TM-2762] p 79 N88-12454

Numerical study of supersonic flow around blunt bodies with extended needle nose

[NASA-TM-89659] p 82 N88-12635

AERODYNAMIC FORCES

Force and pressure distribution measurements on supported, 65 deg delta wings for subsonic and transonic Mach numbers

[NASA-TM-4009] p 69 A88-13434

The influence of unsteady aerodynamic forces on dynamic response of a variable sweep aircraft

[NASA-TM-89659] p 101 A88-14018

Semiempirical method for prediction of aerodynamic forces and moments on a steadily spinning light airplane

[NASA-TM-4009] p 80 N88-12456

AERODYNAMIC HEAT TRANSFER

A study of a multi-layered thin film heat transfer gauge and a new method of measuring heat transfer rate with it

[NASA-TM-89659] p 113 A88-14248

AERODYNAMIC HEATING

The aerodynamics of supersonic parachutes

[DE87-014846] p 81 N88-12464

Parachute materials

[DE87-014845] p 110 N88-12550

AERODYNAMIC INTERFERENCE

Calculation of nonlinear aerodynamic characteristics of interfering airfoils using an eddy cascade method under subsonic flow conditions

[NASA-CR-166577] p 70 A88-13436

A 0.15-scale study of configuration effects on the aerodynamic interaction between main rotor and fuselage

[NASA-CR-166577] p 81 N88-12462

AERODYNAMIC LOADS

Constant pressure panel method for supersonic unsteady airload analysis

[AIAA PAPER 87-2715] p 77 A88-15720

A finite element large deflection random response analysis of beams and plates subjected to acoustic loading

[AIAA PAPER 87-2713] p 116 A88-16562

AERODYNAMIC NOISE

Transition on swept leading edges at Mach 3.5

[NASA-CR-13433] p 77 A88-15722

Numerical simulation of aerodynamic sound radiation from two-dimensional wing

[AIAA PAPER 87-2672] p 123 A88-16536

An experimental investigation of the coherent structure in an incompressible jet

[AIAA PAPER 87-2715] p 124 A88-16563

Cruise noise of the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A

[AIAA PAPER 87-2717] p 125 A88-16565

Flow-induced noise from wind tunnel turbulence reduction screens

[AIAA PAPER 87-2728] p 125 A88-16569

AERODYNAMIC STABILITY

Stability analysis as an aid in the design of laminar profiles

[ESA-TT-1043] p 70 A88-13437

On the prediction of the aeroelastic behavior of lifting systems due to flow separation

[ESA-TT-1043] p 79 N88-11633

Effects of jet exhaust yaw vane installation and operation on the longitudinal and lateral-directional characteristics of the F-14 airplane

[NASA-TP-2769] p 80 N88-12455

AERODYNAMIC STALLING

The effect of pitch location on dynamic stall

[NASA-TP-2769] p 74 A88-14163

Lift-curve characteristics for an airfoil pitching at constant rate

[NASA-TP-2769] p 76 A88-15718

AERODYNAMICS

Development of aerodynamics research at the Institute of Theoretical and Applied Mechanics of the Siberian Branch of the Academy of Sciences of the USSR

[Soviet Journal of Applied Mechanics] p 70 A88-13740

Integrating nonlinear aerodynamic and structural analysis for a complete fighter configuration

[AIAA PAPER 87-2863] p 88 A88-14252

Impulse wind tunnels — Russian book

[Russian Journal of Applied Mechanics] p 76 A88-15676

Numerical solution of flow of ideal fluid through cascade in a plane

[Soviet Journal of Applied Mechanics] p 77 A88-16443

Upper atmosphere aerodynamics - Mathematical modelling and experiment validation

[Soviet Journal of Applied Mechanics] p 78 A88-16863

Modeling XV-15 tilt-rotor aircraft dynamics by frequency and time-domain identification techniques

[Soviet Journal of Applied Mechanics] p 94 A88-11657

New aerodynamic design of the fenestron for improved performance

[Soviet Journal of Applied Mechanics] p 95 A88-11664

AEROELASTIC RESEARCH WINGS

Analytic investigation of helicopter rotor blade appended aerodynamic devices

[NASA-CR-166525] p 95 A88-11676

AEROELASTICITY

Integrating nonlinear aerodynamic and structural analysis for a complete fighter configuration

[AIAA PAPER 87-2863] p 88 A88-14252

Transonic aeroelasticity of wings with tip stores

[NASA-TM-89659] p 92 A88-15719

An approximate approach to estimate the dynamic characteristics of aeroelastic system

[Soviet Journal of Applied Mechanics] p 115 A88-16344

Stochastic modal interaction in linear and nonlinear aeroelastic structures

[Soviet Journal of Applied Mechanics] p 116 A88-16435

On the prediction of the aeroelastic behavior of lifting systems due to flow separation

[ESA-TT-1043] p 79 N88-11633

AERONAUTICAL ENGINEERING

Aircraft design education at the Royal Military College of Science Shrinvenham (CIT) and Kingston Polytechnic

[AIAA PAPER 87-2867] p 127 A88-14256

Aircraft design education in Chile

[AIAA PAPER 87-2869] p 127 A88-14257

Status of titanium alloys R and D described

[Soviet Journal of Applied Mechanics] p 110 N88-11876

AERONAUTICAL SATELLITES

AvSat - An aeronautical satellite communications system

[IAF PAPER 87-477] p 86 A88-16123

Planning of advanced maritime and aeronautical mobile satellite system with multibeam frequency re-use

[IAF PAPER 87-480] p 86 A88-16126

AERONAUTICS

Aeronautical developments for the 21st century

[AIAA PAPER 87-3052] p 65 A88-14878

AEROSPACE ENGINEERING

Aircraft design education at the Royal Military College of Science Shrinvenham (CIT) and Kingston Polytechnic

[AIAA PAPER 87-2867] p 127 A88-14256

AEROSPACE INDUSTRY

Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings

[SAE P-179] p 114 A88-15576

AEROSPACE PLANES

Technology challenges for the National Aero-Space Plane

[IAF PAPER 87-205] p 92 A88-15938

AI applications to the command and control of future aerospaceplane vehicles

[IAF PAPER 87-223] p 108 A88-15951

Combined cycle propulsion for hypersonic flight

[IAF PAPER 87-263] p 99 A88-15978

Aerospaceplane - NASA's flame rekindled

[Soviet Journal of Applied Mechanics] p 65 A88-16376

AEROSPACE SAFETY

Space Shuttle Orbiter ejection seat survey

[NASA-TM-89659] p 108 A88-13390

AEROSTATICS

Airship lift - Static, dynamic and powered static

[Soviet Journal of Applied Mechanics] p 75 A88-14306

AEROTHERMODYNAMICS

A continuum analysis of chemical nonequilibrium under hypersonic low-density flight conditions

[Soviet Journal of Applied Mechanics] p 78 A88-16875

AIR BREATHING ENGINES

Technology challenges for the National Aero-Space Plane

[IAF PAPER 87-205] p 92 A88-15938

Combined cycle propulsion for hypersonic flight

[IAF PAPER 87-263] p 99 A88-15978

AIR DROP OPERATIONS

Developmental airdrop testing techniques and devices

[AGARD-AG-300-VOL-6] p 96 N88-12481

AIR FLOW

On the scheme dependency of the three-dimensional Euler solutions

[Soviet Journal of Applied Mechanics] p 117 N88-12010

AIR NAVIGATION

Aircraft control and navigation system for L 610 aircraft

[Soviet Journal of Applied Mechanics] p 97 A88-16448

The influence of helicopter flight parameters on the results of measurements of horizontal radiation patterns of VHF/UHF broadcasting antennae

[Soviet Journal of Applied Mechanics] p 86 A88-16708

AIR POLLUTION

Aircraft engine exhaust plume dynamics

[AD-A184238] p 100 N88-12488

AIR QUALITY

Aircraft engine exhaust plume dynamics

[AD-A184238] p 100 N88-12488

AIR TRAFFIC CONTROL

Real-time operational planning for the U.S. air traffic system

[Soviet Journal of Applied Mechanics] p 119 A88-13926

The use of speech technology in air traffic control simulators

[Soviet Journal of Applied Mechanics] p 116 A88-16678

Experimental use of artificial intelligence for (future) ATC systems

[PB87-106449] p 121 N88-12970

AIR TRANSPORTATION

The emergence of the rigid airship in the Helltruck

[Soviet Journal of Applied Mechanics] p 66 A88-16658

V/STOL aircraft configurations and opportunities in the Pacific Basin

[NASA-TM-100005] p 85 N88-11644

AIRBORNE EQUIPMENT

System design and effectiveness - Improving built-in-test designs

[AIAA PAPER 87-2945] p 63 A88-14282

Advanced MIL-STD-1553 UHF/VHF radio

[SAE PAPER 880840] p 114 A88-15579

AIRBORNE/SPACEBORNE COMPUTERS

Software considerations for interfacing avionics computers and MUX buses

[SAE PAPER 860853] p 115 A88-15586

A129 advanced solutions for meeting today's combat helicopter requirement

[Soviet Journal of Applied Mechanics] p 95 N88-11669

AIRCRAFT ACCIDENT INVESTIGATION

Aircraft passenger protection from smoke and fire

[Soviet Journal of Applied Mechanics] p 83 A88-13392

Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986

[Soviet Journal of Applied Mechanics] p 84 A88-16735

Accident statistics

[Soviet Journal of Applied Mechanics] p 84 A88-16736

AIRCRAFT ACCIDENTS

Transport aircraft safety - An aviation community commitment

[SAE PAPER 871328] p 128 A88-14360

An airline philosophy to safety

[Soviet Journal of Applied Mechanics] p 85 A88-16738

Aircraft fire safety research

[Soviet Journal of Applied Mechanics] p 85 N88-12526

AIRCRAFT ANTENNAS

The influence of helicopter flight parameters on the results of measurements of horizontal radiation patterns of VHF/UHF broadcasting antennae

[Soviet Journal of Applied Mechanics] p 86 A88-16708

A conformal aircraft phased array antenna for airplane-satellite communication in the L band

[ESA-TT-1057] p 117 N88-11926

AIRCRAFT COMMUNICATION

AvSat - An aeronautical satellite communications system

[IAF PAPER 87-477] p 86 A88-16123

AIRCRAFT COMPARTMENTS

Structural influence of the cabin floor on sound transmission into aircraft - Analytical investigations

[Soviet Journal of Applied Mechanics] p 92 A88-15725

Active control of sound fields in elastic cylinders by multi-control forces

[AIAA PAPER 87-2707] p 124 A88-16559

Fire and foams in transport applications - Aircraft

[Soviet Journal of Applied Mechanics] p 110 A88-16745

Research simulators for helicopters

[Soviet Journal of Applied Mechanics] p 106 N88-11656

[Soviet Journal of Applied Mechanics] p 85 N88-12526

AIRCRAFT CONFIGURATIONS

Aerodynamic analysis of complicated three-dimensional configurations using surface panel methods

[NASA-CR-13266] p 68 A88-13266

Exploiting the close-coupled canard

[AIAA PAPER 87-2864] p 88 A88-14253

A flying saucer??? You are Crazy!!! — review of prototypes of lenticular rigid airships

[Soviet Journal of Applied Mechanics] p 81 A88-14307

Future airliner cockpits

[Soviet Journal of Applied Mechanics] p 92 A88-15381

Use of conformal mapping in grid generation for complex three-dimensional configurations

[Soviet Journal of Applied Mechanics] p 76 A88-15702

- Aerodynamic effects of distributed spanwise blowing on a fighter configuration p 76 A88-15717

 Overlooked potential of systems with Markovian coefficients --- for tracking of maneuvering aircraft p 86 A88-15051
 Improvements to the adaptive maneuvering logic program [NASA-CR-3985] p 93 N88-11648
- AIRCRAFT NOISE**
 The active minimization of harmonic enclosed sound fields. I - Theory. II - A computer simulation. III - Experimental verification p 122 A88-13936
 Structural influence of the cabin floor on sound transmission into aircraft - Analytical investigations p 92 A88-15725
 Light aircraft sound transmission studies - Noise reduction model p 92 A88-16471
 Structure-borne noise control for propeller aircraft [AIAA PAPER 87-2680] p 123 A88-16541
 An advanced system for processing dynamic test data [AIAA PAPER 87-2687] p 105 A88-16543
 Detection of fan acoustic mode [AIAA PAPER 87-2700] p 124 A88-16552
 Models for evaluating the performance of propeller aircraft active noise control systems [AIAA PAPER 87-2704] p 93 A88-16556
 Digital control of sound fields in three-dimensional enclosures --- noise level reduction in turboprop aircraft [AIAA PAPER 87-2706] p 93 A88-16558

- Active control of sound fields in elastic cylinders by multi-control forces p 124 A88-16559
 [AIAA PAPER 87-2707]
 Cruise noise of the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
 [AIAA PAPER 87-2717] p 125 A88-16565
 Added noise due to the effect of an upstream wake on a propeller
 [AIAA PAPER 87-2720] p 125 A88-16566
 Measurements of propeller noise in a light turboprop airplane
 [AIAA PAPER 87-2737] p 93 A88-16575
 A source localization technique for helicopter rotor noise
 [AIAA PAPER 87-2743] p 126 A88-16579
 The prediction of helicopter tail rotor noise on the flight path
 [AIAA PAPER 87-2747] p 126 A88-16581
 A practical helicopter cabin noise simulator
 p 106 A88-16681
 Results of the 1986 NASA/FAA/DFVLR main rotor test entry in the German-Dutch wind tunnel (DNW)
 [NASA-TM-100507] p 127 N88-13003
 Aircraft interior noise reduction by alternate resonance tuning
 [NASA-CR-181530] p 127 N88-13005

AIRCRAFT PARTS

- The analysis of aircraft component failures p 65 A88-15116
 Aircraft equipment systems — Russian book p 92 A88-15648
 A heater made from graphite composite material for potential deicing application p 92 A88-15724
 Operational load measurements on service helicopters p 94 N88-11658

AIRCRAFT PERFORMANCE

- Aerodynamic integration of aft-mounted UHB propulsion systems — Ultra High Bypass p 89 A88-14269
 [AIAA PAPER 87-2920]
 Models for evaluating the performance of propeller aircraft active noise control systems
 [AIAA PAPER 87-2704] p 93 A88-16556
 Jet impingement heat transfer - A literature survey — for aircraft deicing systems
 [ASME PAPER 87-HT-35] p 116 A88-16586
 The FAA advanced simulation plan approval process p 106 A88-16688
 Helicopter (performance) management p 95 N88-11666
 Analytic investigation of helicopter rotor blade appended aeroelastic devices
 [NASA-CR-166525] p 95 N88-11676

AIRCRAFT POWER SUPPLIES

- New developments of European powerplants for helicopters; Proceedings of the Symposium, London, England, Oct. 21, 1986 p 99 A88-16728
 TM 333 and TM 319 turboshafts - Two new powerplants for helicopters p 99 A88-16729

AIRCRAFT PRODUCTION

- Program management of the F-16 program
 [AIAA PAPER 87-2962] p 127 A88-14286
 Aircraft maintenance and production technology; Symposium, Technische Hogeschool Delft, Netherlands, Apr. 25, 1986, Proceedings p 65 A88-14879

AIRCRAFT RELIABILITY

- Design and validation of fault-tolerant flight systems
 [AIAA PAPER 87-2923] p 120 A88-14271
 Do we really understand maintenance?
 [AIAA PAPER 87-2943] p 113 A88-14280
 The impact of product liability litigation on the aviation community - A general aviation aircraft manufacturer's view
 [SAE PAPER 871329] p 128 A88-14361
 The impact of product liability on aviation development
 [SAE PAPER 871330] p 128 A88-14362
 Air worthiness certification in Canada p 84 A88-16661
 The RTM 322 turboshaft engine p 99 A88-16731
 Airworthiness requirements for new engine ratings for helicopters p 100 A88-16734
 Passenger cabin safety - CAA airworthiness requirements p 84 A88-16737
 The Shock and Vibration Digest, Volume 19, No. 11 p 95 N88-11673
 Airworthiness of long-life jet transport structures p 95 N88-11674

AIRCRAFT SAFETY

- Koch emergency egress lighting systems for adverse optical conditions for military and commercial aircraft and other applications p 83 A88-13388
 Aircraft passenger protection from smoke and fire p 83 A88-13392
 NACES - The program and the seat — Navy Aircrew Common Ejection Seat p 88 A88-13395
 Dealing with the problem of delayed ejections p 83 A88-13403

- Laser fiber optic initiation system p 109 A88-13407
 NACES P31 and beyond — Navy Aircrew Common Ejection Seat - PrePlanned Product Improvement p 88 A88-13539
 Transport aircraft safety - An aviation community commitment
 [SAE PAPER 871328] p 128 A88-14360
 Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986 p 84 A88-16735
 Passenger cabin safety - CAA airworthiness requirements p 84 A88-16737
 An airline philosophy to safety p 85 A88-16738
 Passengers and professionals - The safety partnership p 85 A88-16740
 Experimental evidence for modifying the current physical model for ice accretion on aircraft surfaces
 [NASA-TM-87184] p 85 N88-12473

AIRCRAFT SAFETY

- The influence of unsteady aerodynamic forces on dynamic response of a variable sweep aircraft p 101 A88-14018
 An analysis of a candidate control algorithm for a ride quality augmentation system p 101 A88-14277
 [AIAA PAPER 87-2936]
 Research on airship flight dynamics at the University of Toronto p 101 A88-14311
 Local-optimal control in systems with delay p 104 N88-12627

AIRCRAFT STRUCTURES

- Composite structures in homebuilt sport aircraft p 109 A88-13235
 Applications of damage tolerance analysis to in-service aircraft structures p 86 A88-15115
 Application of 'padding offset' in aircraft assembly p 65 A88-16345
 Stochastic modal interaction in linear and nonlinear aeroelastic structures p 116 A88-16435
 Structure-borne noise transmission in stiffened structures
 [AIAA PAPER 87-2679] p 123 A88-16540
 Response of stiffened panels for applications to acoustic fatigue
 [AIAA PAPER 87-2711] p 116 A88-16560
 Vibration analysis of flat skin-stringer structures by the super matrix method
 [AIAA PAPER 87-2734] p 116 A88-16573
 Hypersonic structures and materials - A progress report p 93 A88-16748
 A reliability concept for optimizing aircraft design p 97 N88-12622
 Aircraft dynamic response calculation based on discrete-continual model p 104 N88-12624
 Aircraft classification by type of propulsive devices. Determination of type and number of carrying solutions p 97 N88-12626

AIRCRAFT WAKES

- Free-wake analysis of helicopter rotors - A boundary element approach p 68 A88-13265
 Added noise due to the effect of an upstream wake on a propeller
 [AIAA PAPER 87-2720] p 125 A88-16566

AIRFOIL OSCILLATIONS

- Unsteady Newtonian flow over two-dimensional airfoils p 74 A88-14246

AIRFOIL PROFILES

- Potential hydrodynamic effects on structures by the boundary element method p 111 A88-13268
 Pressure wave-boundary layer interaction p 112 A88-13440
 On steady supersonic flow over two-dimensional airfoils p 74 A88-14250
 A fast approach to designing airfoils from given pressure distribution in compressible flows
 [AIAA PAPER 87-2862] p 74 A88-14251
 Newtonian theory for the compression surface of airfoils at moderate or large incidence p 76 A88-15701
 A critical assessment of wind tunnel results for the NACA 0012 airfoil
 [NASA-TM-100019] p 79 N88-11638

AIRFOILS

- Experimental investigation of shock-boundary layer interference with passive influence p 69 A88-13431
 Calculation of nonlinear aerodynamic characteristics of interfering airfoils using an eddy cascade method under subsonic flow conditions p 70 A88-13436
 The calculation of aerofoil friction drag in compressibility viscous flow p 71 A88-14023
 Unsteady separation at low Reynolds numbers p 73 A88-14150
 Features of transitional separation bubbles in an oscillating freestream p 73 A88-14161
 On the unsteady flow past an impulsively started airfoil at a high angle of attack p 74 A88-14162
 The effect of pitch location on dynamic stall p 74 A88-14163

 The Hystar Aerodyne airship p 66 A88-16659
 Maritime missions using an integrated LTA role p 84 A88-16660
 Air worthiness certification in Canada p 84 A88-16661
 An overview of Ulita Industries Inc. p 66 A88-16662
 An introduction to US Airship and the USA-100 p 66 A88-16663
 A heat transfer model for a heated helium airship
 [AD-A183786] p 78 N88-11629
 Renewed interest in airships for industry use discussed p 82 N88-12628

ALGORITHMS

- Vectorizable implicit algorithms for the flux-difference split, three-dimensional Navier-Stokes equations p 120 A88-14103
 Flight control of an X-29 type aircraft via a combination of LQ optimization techniques p 101 A88-14960

- Overlooked potential of systems with Markovian coefficients --- for tracking of maneuvering aircraft p 86 A88-15051
- Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 N88-12469
- GPS vertical axis performance enhancement for helicopter precision landing approach [NASA-CR-177443] p 86 N88-12477
- ALTITUDE TESTS**
Measured performance of the heat exchanger in the NASA icing research tunnel under severe icing and dry-air conditions [NASA-TM-100116] p 118 N88-12796
- ALUMINUM ALLOYS**
Development of particulate reinforced high strength aluminium alloy for aerospace applications p 109 A88-13198
- ANALOG SIMULATION**
Study of the effects of discretizing quantitative feedback theory analog control system designs --- for transport and fighter aircraft p 102 A88-15033
- ANGLE OF ATTACK**
On the unsteady flow past an impulsively started airfoil at a high angle of attack p 74 A88-14162
The effect of pitch location on dynamic stall p 74 A88-14163
X-31A --- West German/USA experimental aircraft [SAE PAPER 871346] p 91 A88-14370
Aerodynamic effects of distributed spanwise blowing on a fighter configuration p 76 A88-15717
Numerical studies on rarefied flow over a flat plate at an angle of attack p 78 A88-16852
Optimum take-off run of aircraft on ground airfields p 97 N88-12623
- ANTENNA ARRAYS**
A conformal aircraft phased array antenna for airplane-satellite communication in the L band [ESA-TT-1057] p 117 N88-11926
- ANTENNA DESIGN**
The influence of helicopter flight parameters on the results of measurements of horizontal radiation patterns of VHF/UHF broadcasting antennae p 86 A88-16708
- ANTENNA RADIATION PATTERNS**
The influence of helicopter flight parameters on the results of measurements of horizontal radiation patterns of VHF/UHF broadcasting antennae p 86 A88-16708
- APPLICATIONS PROGRAMS (COMPUTERS)**
A heat transfer model for a heated helium airship [AD-A183786] p 78 N88-11629
Improvements to the adaptive maneuvering logic program [NASA-CR-3985] p 93 N88-11648
Analytic investigation of helicopter rotor blade appended aeroelastic devices [NASA-CR-166525] p 95 N88-11676
A hybrid numerical technique for predicting the aerodynamic and acoustic fields of advanced turboprops [NASA-CR-174926] p 126 N88-12352
Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 N88-12469
An integrated study of structures, aerodynamics and controls on the forward swept wing X-29A and the oblique wing research aircraft [NASA-CR-181548] p 96 N88-12486
Applications of the hybrid automated reliability predictor [NASA-TP-2760] p 121 N88-12928
- APPROACH**
GPS vertical axis performance enhancement for helicopter precision landing approach [NASA-CR-177443] p 86 N88-12477
Effect of motion cues during complex curved approach and landing tasks: A piloted simulation study [NASA-TP-2773] p 96 N88-12480
- APPROXIMATION**
An approximate approach to estimate the dynamic characteristics of aeroelastic system p 115 A88-16344
- ARCHITECTURE (COMPUTERS)**
An evaluation plan of bus architectures and protocols using the NASA Ames intelligent redundant actuation system [NASA-CR-177458] p 96 N88-12482
- ARTIFICIAL INTELLIGENCE**
AI applications to the command and control of future aerospaceplane vehicles [IAF PAPER 87-223] p 108 A88-15951
Experimental use of artificial intelligence for (future) ATC systems [PB87-106449] p 121 N88-12970
- ASSEMBLING**
Application of 'padding offset' in aircraft assembly p 65 A88-16345
- ASYMPTOTIC METHODS**
A nonlinear, asymptotic investigation of the stationary modes of instability of the three-dimensional boundary layer on a rotating disc p 114 A88-15455
- ATMOSPHERIC CHEMISTRY**
A continuum analysis of chemical nonequilibrium under hypersonic low-density flight conditions p 78 A88-16875
- ATMOSPHERIC DENSITY**
A continuum analysis of chemical nonequilibrium under hypersonic low-density flight conditions p 78 A88-16875
- ATMOSPHERIC ELECTRICITY**
Charge simulation method for the calculation of electromagnetic fields radiated from lightning p 119 A88-13261
- ATMOSPHERIC MODELS**
Charge simulation method for the calculation of electromagnetic fields radiated from lightning p 119 A88-13261
- ATTACK AIRCRAFT**
The B. Ae. Hawk - A first decade of development [AIAA PAPER 87-2911] p 89 A88-14266
- AUTOMATED EN ROUTE ATC**
The use of speech technology in air traffic control simulators p 116 A88-16678
- AUTOMATIC CONTROL**
Aircraft control and navigation system for L 610 aircraft p 97 A88-16448
Some data processing requirements for precision Nap-Of-the-Earth (NOE) guidance and control of rotorcraft [NASA-CR-177453] p 104 N88-12493
- AUTOMATIC FLIGHT CONTROL**
MD-11 design - Evolution, not revolution [AIAA PAPER 87-2928] p 90 A88-14274
- AUTOMATION**
Automated fabrication of graphite-epoxy composites p 109 A88-13220
- AVIONICS**
System design and effectiveness - Improving built-in-test designs [AIAA PAPER 87-2945] p 63 A88-14282
The experimental aircraft programme [SAE PAPER 871347] p 64 A88-14371
Aerospace Avionics Equipment and Integration Conference and Exhibit, Phoenix, AZ, Apr. 23, 24, 1986, Proceedings [SAE P-179] p 114 A88-15576

Wind shear tunnel with inclined wire gauze p 105 A88-14000
The 0.6m x 0.6m trisonic test section (TMK) of DFVLR in Cologne-Porz, Federal Republic of Germany (status 1986) [ESA-TT-1052] p 106 N88-11681
The vertical test section (VMK) of DFVLR in Cologne-Porz, Federal Republic of Germany (status 1986) [ESA-TT-1053] p 107 N88-11682
The design and preliminary calibration of a boundary-layer flow channel [NASA-CR-178399] p 80 N88-12457
- BLUNT BODIES**
Modeling of large-scale vortex structures in supersonic turbulent flow past blunt bodies p 71 A88-13761
An improved stagnation point viscous shock layer flow over a blunt body p 78 A88-16861
Numerical study of supersonic flow around blunt bodies with extended needle nose p 82 N88-12635
- BOEING 737 AIRCRAFT**
Simulation of an enhanced TCAS 2 system in operation [NASA-CR-181545] p 87 N88-12479
- BOUNDARY ELEMENT METHOD**
Betch 86; Proceedings of the Second Boundary Element Technology Conference, MIT, Cambridge, MA, June 17-19, 1986 p 119 A88-13257
Free-wake analysis of helicopter rotors - A boundary element approach p 68 A88-13265
Potential hydrodynamic effects on structures by the boundary element method p 111 A88-13268
A boundary element method for unsteady viscous flows p 68 A88-13270
Shape optimization utilizing a boundary element formulation p 111 A88-13281
- BOUNDARY INTEGRAL METHOD**
A high order panel method for determining incompressible flows around arbitrary bodies p 68 A88-13267
- BOUNDARY LAYER CONTROL**
Investigations on a transonic airfoil with a 30 mm wide perforation/cavity arrangement [ESA-TT-1072] p 79 N88-11634
- BOUNDARY LAYER FLOW**
Experimental investigation of shock-boundary layer interference with passive influence p 69 A88-13431
Pressure wave-boundary layer interaction p 112 A88-13440
The Goertler instability on an airfoil [AIAA PAPER 85-0491] p 75 A88-14848
Impulse wind tunnels --- Russian book p 76 A88-15676
Aeroacoustic effects of body blockage in cavity flow [AIAA PAPER 87-2667] p 123 A88-16533
A model of the wall boundary layer for ducted propellers [AIAA PAPER 87-2742] p 126 A88-16578
The design and preliminary calibration of a boundary-layer flow channel [NASA-CR-178399] p 80 N88-12457
- BOUNDARY LAYER SEPARATION**
Flows with separation; DGLR Specialists' Symposium, 5th, Munich, Federal Republic of Germany, Oct. 9, 10, 1986, Reports [DGLR-BERICHT 86-03] p 111 A88-13426
Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings p 112 A88-14141

- Break-up in unsteady separation p 112 A88-14149
Unsteady separation at low Reynolds numbers p 73 A88-14150
- Flow development on a Joukowski airfoil started impulsively from rest p 74 A88-14164
Calculation of three-dimensional stationary turbulent boundary layer on root section of wing ignoring compressibility p 82 N88-12630
- BOUNDARY LAYER STABILITY**
An experimental study of the stability of a supersonic boundary layer on a cone p 71 A88-13759
A nonlinear, asymptotic investigation of the stationary modes of instability of the three-dimensional boundary layer on a rotating disc p 114 A88-15455
- BOUNDARY LAYER TRANSITION**
Excitation of natural oscillations of a boundary layer by an external acoustic field p 118 N88-12634
- BUBBLES**
Features of transitional separation bubbles in an oscillating freestream p 73 A88-14161
- BUFFETING**
On the prediction of the aeroelastic behavior of lifting systems due to flow separation [ESA-TT-1043] p 79 N88-11833
- BUS CONDUCTORS**
Aircraft/stores data bus networks [SAE PAPER 860842] p 115 A88-15581
An overview of SAE AE-9B high speed ring bus (HSRB) performance [SAE PAPER 860844] p 115 A88-15583
Software considerations for interfacing avionics computers and MUX buses [SAE PAPER 860853] p 115 A88-15586
Sperry's solution to the Army's IDAS program --- Integrated Digital Avionics System [SAE PAPER 860856] p 97 A88-15588
- BYPASS RATIO**
Aerodynamic integration of aft-mounted UHB propulsion systems --- Ultra High Bypass [AIAA PAPER 87-2920] p 89 A88-14269
Aerodynamic design characteristic of test cell for high by-pass ratio turbofan engine p 77 A88-16338

C

- CABINS**
A practical helicopter cabin noise simulator p 106 A88-16681
Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986 p 84 A88-16735
Passenger cabin safety - CAA airworthiness requirements p 84 A88-16737
- CALIBRATING**
The calibration and operation of a constant-temperature crossed-wire probe in supersonic flow p 113 A88-14175
A demonstration of the use of an airship for towing a reflective sphere at medium altitudes p 64 A88-14313
The design and preliminary calibration of a boundary-layer flow channel [NASA-CR-178399] p 80 N88-12457
- CANARD CONFIGURATIONS**
Experimental studies on canard configurations p 69 A88-13433
Steady and unsteady aerodynamic interference in closely coupled canard/wing configurations p 73 A88-14147
Exploiting the close-coupled canard [AIAA PAPER 87-2864] p 88 A88-14253
X-29A flight control system performance during flight test [AIAA PAPER 87-2878] p 101 A88-14259
- CARBON FIBER REINFORCED PLASTICS**

- CARGO**
Developmental airdrop testing techniques and devices [AGARD-AG-300-VOL-6] p 96 N88-12481
- CARRIER FREQUENCIES**
High dynamic GPS receiver using maximum likelihood estimation and frequency tracking p 86 A88-15360
- CARTRIDGES**
Failure analyses of steel breech chambers used with aircraft cartridge ignition starters p 113 A88-15114
- CASCADE FLOW**
Pressure wave-boundary layer interaction p 112 A88-13440
Addendum to the calculation of transonic potential flow through a two-dimensional cascade p 70 A88-13545
A design of the cascade for a shock-in-rotor supersonic axial-flow compressor p 70 A88-13546
A mixed direct-inverse problem of the transonic cascade p 71 A88-14017

- Numerical solution of flow of ideal fluid through cascade in a plane p 77 A88-16443
- CAVITIES**
Aeroacoustic effects of body blockage in cavity flow [AIAA PAPER 87-2667] p 123 A88-16533
Investigations on a transonic airfoil with a 30 mm wide perforation/cavity arrangement [ESA-TT-1072] p 79 N88-11634
- CEMENTS**
Open-graded bases for airfield pavements [AD-A184461] p 108 N88-12500
- CENTER OF GRAVITY**
MD-11 design - Evolution, not revolution [AIAA PAPER 87-2928] p 90 A88-14274
Effect of permissible variations of center-of-gravity locations of cargo airplane on its mass p 97 N88-12625
- CENTRAL PROCESSING UNITS**
The development of a standard electronic module with MIL-STD-1750A capabilities [SAE PAPER 860838] p 114 A88-15578
Software considerations for interfacing avionics computers and MUX buses [SAE PAPER 860853] p 115 A88-15586
Sperry's solution to the Army's IDAS program --- Integrated Digital Avionics System [SAE PAPER 860856] p 97 A88-15588
- CERTIFICATION**
Air worthiness certification in Canada p 84 A88-16661
- CESSNA AIRCRAFT**
The impact of product liability on aviation development [SAE PAPER 871330] p 128 A88-14362
- CHANNEL FLOW**
The design and preliminary calibration of a boundary-layer flow channel [NASA-CR-178399] p 80 N88-12457
- CHANNELS (DATA TRANSMISSION)**
An evaluation plan of bus architectures and protocols using the NASA Ames intelligent redundant actuation system [NASA-CR-177458] p 96 N88-12482
- CIRCULAR CYLINDERS**
Details of the computed flowfield over a circular cylinder at Reynolds number 1200 p 73 A88-14159
Analysis of unsteady wake of a circular cylinder using Navier-Stokes equations p 73 A88-14160
- CIRCULAR TUBES**
Numerical study of the entrance flow and its transition in a circular pipe (2) p 117 N88-12011
- CIVIL AVIATION**
Real-time operational planning for the U.S. air traffic system p 119 A88-13926
Civil application for airships by Airship Industries p 64 A88-14303
Military and civil applications for airships p 64 A88-14308
Jet impingement heat transfer - A literature survey --- for aircraft deicing systems [ASME PAPER 87-HT-35] p 116 A88-16586
The FAA advanced simulation plan approval process p 106 A88-16688
Civil applications of high-speed rotorcraft and powered-lift aircraft configurations [NASA-TM-100035] p 85 N88-11643
Design requirements for future commercial operations p 94 N88-11651
The EH-101 integrated project: A naval, utility and commercial helicopter system p 95 N88-11672
- CLASSICAL MECHANICS**
Composite mechanics for engine structures [NASA-TM-100176] p 111 N88-12552
- CLASSIFICATIONS**
Aircraft classification by type of propulsive devices. Determination of type and number of carrying solutions p 97 N88-12626
- COAXIAL NOZZLES**
Measurement on acoustic source-strength distribution of coaxial jets [AIAA PAPER 87-2716] p 124 A88-16564
- COCKPIT SIMULATORS**
Cockpit procedure trainers for military aircraft p 106 A88-16683
A low cost flight simulator for twin-engined general aircraft p 106 A88-16686
- COCKPITS**
Advanced technology cockpit program p 88 A88-13540
MD-11 design - Evolution, not revolution [AIAA PAPER 87-2928] p 90 A88-14274
Future airliner cockpits p 92 A88-15381
Advanced MIL-STD-1553 UHF/VHF radio [SAE PAPER 860840] p 114 A88-15579
Sperry's solution to the Army's IDAS program --- Integrated Digital Avionics System [SAE PAPER 860856] p 97 A88-15588

- MBB simulation facilities applied for rotorcraft research p 106 N88-11655
Helicopter (performance) management p 95 N88-11686
Effects of combining vertical and horizontal information into a primary flight display [NASA-TP-2783] p 98 N88-12487
- COLLISION AVOIDANCE**
UK airmiss statistics p 85 N88-11642
Handling qualities criterion for very low visibility rotorcraft p 103 N88-11654
Simulation of an enhanced TCAS 2 system in operation [NASA-CR-181545] p 87 N88-12479
- COMBAT**
Improvements to the adaptive maneuvering logic program [NASA-CR-3985] p 93 N88-11648
- COMBINED CYCLE POWER GENERATION**
Combined cycle propulsion for hypersonic flight [IAF PAPER 87-263] p 99 A88-15978
- COMBUSTION EFFICIENCY**
Performance and combustion characteristics of direct-injection stratified-charge rotary engines [NASA-TM-100134] p 100 N88-12490
- COMMAND AND CONTROL**
AI applications to the command and control of future aerospaceplane vehicles [IAF PAPER 87-223] p 108 A88-15951
- COMMERCIAL AIRCRAFT**
Koch emergency egress lighting systems for adverse optical conditions for military and commercial aircraft and other applications p 83 A88-13388
Inclined planes --- tilt-rotor aircraft configurations p 88 A88-13973
An analysis of a candidate control algorithm for a ride quality augmentation system [AIAA PAPER 87-2936] p 101 A88-14277
Civil application for airships by Airship Industries p 64 A88-14303
Aircraft maintenance and production technology; Symposium, Technische Hogeschool Delft, Netherlands, Apr. 25, 1986, Proceedings p 65 A88-14879
Future airliner cockpits p 92 A88-15381
Accident statistics p 84 A88-16736
Passenger cabin safety - CAA airworthiness requirements p 84 A88-16737
An airline philosophy to safety p 85 A88-16738
Passengers and professionals - The safety partnership p 85 A88-16740
Design requirements for future commercial operations p 94 N88-11651
- COMMUNICATION SATELLITES**
AvSat - An aeronautical satellite communications system [IAF PAPER 87-477] p 86 A88-16123
- COMPONENT RELIABILITY**
The Shock and Vibration Digest, Volume 19, No. 11 p 95 N88-11673
- COMPOSITE MATERIALS**
Failure analysis of composite structure materials [AD-A184468] p 110 N88-12548
Composite mechanics for engine structures [NASA-TM-100176] p 111 N88-12552
- COMPOSITE STRUCTURES**
A computer aided aircraft structural composite repair system p 109 A88-13168
Composite drive shafting applications p 109 A88-13177
Composite structures in homebuilt sport aircraft p 109 A88-13235
An experimental investigation of wing/fuselage integration geometries [AIAA PAPER 87-2937] p 74 A88-14278
Failure analysis of composite structure materials [AD-A184468] p 110 N88-12548
Composite mechanics for engine structures [NASA-TM-100176] p 111 N88-12552
- COMPOUND HELICOPTERS**
Rotorcraft designs for the year 2000 p 95 N88-11685
- COMPRESSIBLE BOUNDARY LAYER**
Organized structures in a compressible, turbulent boundary layer p 75 A88-14458
- COMPRESSIBLE FLOW**
The theoretical model and numerical solution for the compressible viscous vortex cores p 71 A88-14016
The calculation of aerofoil friction drag in compressibility viscous flow p 71 A88-14023
A fast approach to designing airfoils from given pressure distribution in compressible flows [AIAA PAPER 87-2862] p 74 A88-14251

COMPRESSOR ROTORS

- Three-dimensional calculation in high subsonic axial compressor rotor and its comparison with L2F velocity measurement p 117 N88-11886

COMPUTATION

- Aircraft dynamic response calculation based on discrete-continual model p 104 N88-12624
Calculation of three-dimensional stationary turbulent boundary layer on root section of wing ignoring compressibility p 82 N88-12630

COMPUTATIONAL FLUID DYNAMICS

- Free-wake analysis of helicopter rotors - A boundary element approach p 68 A88-13265
Aerodynamic analysis of complicated three-dimensional configurations using surface panel methods p 68 A88-13266
Potential hydrodynamic effects on structures by the boundary element method p 111 A88-13268
A boundary element method for unsteady viscous flows p 68 A88-13270
Flow around a cone at supersonic speed p 68 A88-13287
Flows with separation; DGLR Specialists' Symposium, 5th, Munich, Federal Republic of Germany, Oct. 9, 10, 1986, Reports [DGLR-BERICHT 86-03] p 111 A88-13426
Eddy generation in heat conductors p 112 A88-13427
Addendum to the calculation of transonic potential flow through a two-dimensional cascade p 70 A88-13545
The theoretical model and numerical solution for the compressible viscous vortex cores p 71 A88-14016
A mixed direct-inverse problem of the transonic cascade p 71 A88-14017
Zero-lift drag predictions in supersonic flow for complex configurations p 71 A88-14021
The calculation of aerofoil friction drag in compressibility viscous flow p 71 A88-14023
Applications of parallel processing in fluid mechanics; Proceedings of the Applied Mechanics, Bioengineering, and Fluids Engineering Conference, Cincinnati, OH, June 14-17, 1987 p 119 A88-14101
Vectorizable implicit algorithms for the flux-difference split, three-dimensional Navier-Stokes equations p 120 A88-14103
Supercomputing of supersonic flows using upwind relaxation and MacCormack schemes p 71 A88-14105
Performance of a three-dimensional Navier-Stokes code on CYBER 205 for high-speed juncture flows p 72 A88-14108
Computation of subsonic base flow on a vector processor p 72 A88-14109
Computations of a turbulent jet-edge flow field p 72 A88-14126
Calculation of wall and free turbulent-shear flows at supersonic speeds p 72 A88-14134
Vortex dynamics of slender wings as a numerical experiment with discrete-vortex methods p 73 A88-14146
Steady and unsteady aerodynamic interference in closely coupled canard/wing configurations p 73 A88-14147
Break-up in unsteady separation p 112 A88-14149
Unsteady separation at low Reynolds numbers p 73 A88-14150
Integrating nonlinear aerodynamic and structural analysis for a complete fighter configuration [AIAA PAPER 87-2863] p 88 A88-14252
A comparison of flutter analyses for a 45 deg swept model [AIAA PAPER 87-2886] p 89 A88-14263
A geometry system for aerodynamic design [AIAA PAPER 87-2902] p 120 A88-14265
Numerical modeling of stationary separated flows p 114 A88-15186
A perspective of computational fluid dynamics p 75 A88-15205
Newtonian theory for the compression surface of airfoils at moderate or large incidence p 76 A88-15701
Use of conformal mapping in grid generation for complex three-dimensional configurations p 76 A88-15702
Block-structured solution scheme for analyzing three-dimensional transonic potential flows p 76 A88-15703
Computation of the compensation pitot tube in front of the nose inlet of an aircraft at transonic speed p 77 A88-16341
Retooling CFD for hypersonic aircraft p 67 A88-16749
A supersonic potential gradient method for the calculation of unsteady aerodynamic pressures on harmonically oscillating wings [ESA-TT-930] p 79 N88-11631

Analytic investigation of helicopter rotor blade appended aerolastic devices [NASA-CR-166525] p 95 N88-11676

- On the scheme dependency of the three-dimensional Euler solutions p 117 N88-12010
Numerical study of the entrance flow and its transition in a circular pipe (2) p 117 N88-12011
Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 N88-12469
Experimental aerothermodynamic research of hypersonic aircraft [NASA-CR-181533] p 96 N88-12483
Some asymptotic modes of transonic vortex flow p 82 N88-12632
Numerical study of supersonic flow around blunt bodies with extended needle nose p 82 N88-12635

COMPUTATIONAL GRIDS

- A perspective of computational fluid dynamics p 75 A88-15205
Use of conformal mapping in grid generation for complex three-dimensional configurations p 76 A88-15702
Block-structured solution scheme for analyzing three-dimensional transonic potential flows p 76 A88-15703
Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 N88-12469

COMPUTER AIDED DESIGN

Passenger cabin safety; Proceedings of the Symposium, London, England, Oct. 29, 1986 p 84 A88-16735
Rotorcraft Design for Operations [AGARD-CP-423] p 94 A88-11649

CONFORMAL MAPPING

- Use of conformal mapping in grid generation for complex three-dimensional configurations p 76 A88-15702

CONICAL BODIES

- Flow around a cone at supersonic speed p 68 A88-13287
Conical wing with maximum lift-to-drag ratio in supersonic gas flow p 82 N88-12633

CONICAL FLOW

- Flow around a cone at supersonic speed p 68 A88-13287
An experimental study of the stability of a supersonic boundary layer on a cone p 71 A88-13759

CONICAL SHELLS

- Free vibration of conical shell panels p 112 A88-13940

CONSOLIDATION

- Effects of combining vertical and horizontal information into a primary flight display [NASA-TP-2783] p 98 N88-12487

CONTAMINATION

- Contamination control of aircraft hydraulic systems p 92 A88-16337

CONTRAROTATING PROPELLERS

Noise prediction of counter rotation propeller
[AIAA PAPER 87-2658] p 122 A88-16527

CONTROL

Advanced MIL-STD-1553 UHF/VHF radio
[SAE PAPER 860840] p 114 A88-15579
Sperry's solution to the Army's IDAS program ---
Integrated Digital Avionics System
[SAE PAPER 860856] p 97 A88-15588
Contamination control of aircraft hydraulic systems
p 92 A88-16337

CONTROL SURFACES

Experimental aerothermodynamic research of
hypersonic aircraft
[NASA-CR-181533] p 96 N88-12483

CONTROL SYSTEMS DESIGN

X-29A flight control system performance during flight
test
[AIAA PAPER 87-2878] p 101 A88-14259
Flight control synthesis to meet flying qualities
specifications - An evaluation of multivariable synthesis
techniques
[AIAA PAPER 87-2880] p 101 A88-14260
Future directions in L(infinity) robust control theory
p 121 A88-14945
A decoupling approach to the design of the
two-degree-of-freedom tracking control systems --- for
fighter aircraft p 102 A88-14961
Study of the effects of discretizing quantitative feedback
theory analog control system designs --- for transport and
fighter aircraft p 102 A88-15033
Mechanisms of active control in cylindrical fuselage
structures
[AIAA PAPER 87-2703] p 102 A88-16555
Digital control of sound fields in three-dimensional
enclosures --- noise level reduction in turboprop aircraft
[AIAA PAPER 87-2706] p 93 A88-16558
Control of shear flows by artificial excitation
[AIAA PAPER 87-2722] p 78 A88-16567
RTM322 electronic control and anticipated
developments p 99 A88-16732
TM 319 and TM 333 electronic control design and
operational features p 99 A88-16733
Application of a fuzzy controller in fuel system of turbojet
engine p 100 A88-16902
Theoretical and experimental study of flow-control
devices for inlets of indraft wind tunnels
p 107 N88-11684

CONTROL THEORY

Future directions in L(infinity) robust control theory
p 121 A88-14945
Study of the effects of discretizing quantitative feedback
theory analog control system designs --- for transport and
fighter aircraft p 102 A88-15033
Application of a fuzzy controller in fuel system of turbojet
engine p 100 A88-16902

CONTROLLERS

Application of a fuzzy controller in fuel system of turbojet
engine p 100 A88-16902
Minimisation of helicopter vibration through active
control of structural response p 103 N88-11662
Local-optimal control in systems with delay
p 104 N88-12627

CONVECTION

A heat transfer model for a heated helium airship
[AD-A183786] p 78 N88-11629

CONVERGENT-DIVERGENT NOZZLES

Nozzle geometry effects on supersonic jet interaction
[AIAA PAPER 87-2694] p 123 A88-16548

COOLING

Heat removal key to shrinking avionics
p 117 A88-16747

CORE FLOW

The theoretical model and numerical solution for the
compressible viscous vortex cores p 71 A88-14016

CORNER FLOW

Diffraction of an oblique shock wave in the vicinity of
an external right-angle corner p 70 A88-13741

COUNTER ROTATION

Numerical solutions of the Euler equations for the flow
field around counter-rotating propellers
p 70 A88-13544

Noise characteristics of model counter-rotating
Prop-Fans
[AIAA PAPER 87-2656] p 122 A88-16526

A study of some factors affecting the aeroacoustic
performance of a ducted contra-rotating axial flow fan
stage
[AIAA PAPER 87-2730] p 125 A88-16570

CRACK INITIATION

Crack initiation and propagation due to cyclic thermal
gradients --- aircraft turbine blades
[ESA-TT-1023] p 118 N88-12114

CRACK PROPAGATION

Applications of damage tolerance analysis to in-service
aircraft structures p 86 A88-15115

The analysis of aircraft component failures
p 65 A88-15116

The effects of prestress on low cycle fatigue and fatigue
crack growth behaviours for alloy GH33A
p 110 A88-16331

Crack initiation and propagation due to cyclic thermal
gradients --- aircraft turbine blades
[ESA-TT-1023] p 118 N88-12114

CRANES

Renewed interest in airships for industry use
discussed p 82 N88-12628

CROSS FLOW

Jet impingement heat transfer - A literature survey ---
for aircraft deicing systems
[ASME PAPER 87-HT-35] p 116 A88-16586

CRUISING FLIGHT

A method to optimize nacelle shape in a supersonic
cruise aircraft
[AIAA PAPER 87-2865] p 89 A88-14254

CUES

Handling qualities criterion for very low visibility
rotorcraft p 103 N88-11654
Effect of motion cues during complex curved approach
and landing tasks: A piloted simulation study
[NASA-TP-2773] p 96 N88-12480

CUMULATIVE DAMAGE

Multiple-mode large deflection random response of
beams with nonlinear damping subjected to acoustic
excitation
[AIAA PAPER 87-2712] p 116 A88-16561

CUSHIONS

Application of 'padding offset' in aircraft assembly
p 65 A88-16345

CYCLIC LOADS

Crack initiation and propagation due to cyclic thermal
gradients --- aircraft turbine blades
[ESA-TT-1023] p 118 N88-12114

CYLINDRICAL BODIES

Mechanisms of active control in cylindrical fuselage
structures
[AIAA PAPER 87-2703] p 102 A88-16555

CYLINDRICAL SHELLS

Models for evaluating the performance of propeller
aircraft active noise control systems
[AIAA PAPER 87-2704] p 93 A88-16556

D

DAMAGE

Applications of damage tolerance analysis to in-service
aircraft structures p 86 A88-15115
Airworthiness of long-life jet transport structures
p 95 N88-11674

DAMPING

Multiple-mode large deflection random response of
beams with nonlinear damping subjected to acoustic
excitation
[AIAA PAPER 87-2712] p 116 A88-16561

DATA MANAGEMENT

Aircraft/stores data bus networks
[SAE PAPER 860842] p 115 A88-15581

DATA PROCESSING

An advanced system for processing dynamic test data
[AIAA PAPER 87-2687] p 105 A88-16543

DATA PROCESSING TERMINALS

Software considerations for interfacing avionics
computers and MUX buses
[SAE PAPER 860853] p 115 A88-15586

DC 9 AIRCRAFT

The payoff of a dedicated flight test aircraft for the MD-80
family
[AIAA PAPER 87-2950] p 90 A88-14285

DECISION MAKING

Compromise - An effective approach for conceptual
aircraft design
[AIAA PAPER 87-2965] p 90 A88-14287

DECOUPLING

A decoupling approach to the design of the
two-degree-of-freedom tracking control systems --- for
fighter aircraft p 102 A88-14961

DEFENSE

Maritime missions using an integrated LTA role
p 84 A88-16660

DEFENSE PROGRAM

Airships face a military future p 63 A88-14050
Defense suppression technology alternatives for future
generation aircraft
[AIAA PAPER 87-2925] p 63 A88-14273

DEFLECTION

A finite element large deflection random response
analysis of beams and plates subjected to acoustic
loading
[AIAA PAPER 87-2713] p 116 A88-16562

DEGREES OF FREEDOM

A decoupling approach to the design of the
two-degree-of-freedom tracking control systems --- for
fighter aircraft p 102 A88-14961

DEICING

A heater made from graphite composite material for
potential deicing application p 92 A88-15724
Jet impingement heat transfer - A literature survey ---
for aircraft deicing systems
[ASME PAPER 87-HT-35] p 116 A88-16586

DELIVERY

Developmental airpod testing techniques and devices
[AGARD-AG-300-VOL-6] p 96 N88-12481

DELTA WINGS

Eddy generation in heat conductors
p 112 A88-13427
Experimental research on the structure and 'bursting'
of eddies on a slender delta wing - Conducted in a wind
tunnel using an acoustooptic measurement method
p 69 A88-13429
Experimental investigations on double delta wings under
asymmetric flow conditions p 69 A88-13432
Experimental studies on canard configurations
p 69 A88-13433
Force and pressure distribution measurements on
supported, 65 deg delta wings for subsonic and transonic
Mach numbers p 69 A88-13434
Flow field study on a 65 deg delta wing
p 69 A88-13435
Response of a delta wing in steady and unsteady flow
p 72 A88-14144
An experimental investigation of dynamic ground
effect
[NASA-CR-4105] p 80 N88-12458

DESIGN ANALYSIS

Design and validation of fault-tolerant flight systems
[AIAA PAPER 87-2923] p 120 A88-14271
The impact of product liability litigation on the aviation
community - A general aviation aircraft manufacturer's
view
[SAE PAPER 871329] p 128 A88-14361
Rotorcraft Design for Operations
[AGARD-CP-423] p 94 A88-11649
The influence of operational requirements on LHX
concept formulation p 94 A88-11650
Design requirements for future commercial operations
p 94 A88-11651
The design and preliminary calibration of a
boundary-layer flow channel
[NASA-CR-178399] p 80 N88-12457

DIFFERENCE EQUATIONS

Overlooked potential of systems with Markovian
coefficients --- for tracking of maneuvering aircraft
p 86 A88-15051

DIFFERENCES

GPS vertical axis performance enhancement for
helicopter precision landing approach
[NASA-CR-177443] p 86 N88-12477

DIGITAL DATA

Digital control of sound fields in three-dimensional
enclosures --- noise level reduction in turboprop aircraft
[AIAA PAPER 87-2706] p 93 A88-16558

DIGITAL ELECTRONICS

TM 319 and TM 333 electronic control design and
operational features p 99 A88-16733

DIGITAL SIMULATION

Numerical simulation of two-dimensional transonic flow
over thin oscillating airfoil p 77 A88-16442

DIGITAL SYSTEMS

CREST flight controller --- for ejection seat
p 88 A88-13394
Digital-flight-control-system software written in
automated-engineering-design language: A user's guide
of verification and validation tools
[NASA-TM-88313] p 104 N88-12494

DIGITAL TECHNIQUES

Sperry's solution to the Army's IDAS program ---
Integrated Digital Avionics System
[SAE PAPER 860856] p 97 A88-15588

DIRECTIONAL ANTENNAS

High dynamic GPS receiver using maximum likelihood
estimation and frequency tracking p 86 A88-15360

DIRECTIONAL STABILITY

Effects of jet exhaust yaw vane installation and operation
on the longitudinal and lateral-directional characteristics
of the F-14 airplane
[NASA-TP-2769] p 80 N88-12455

DISCRETE FUNCTIONS

Solution of the two-dimensional Euler equations on
unstructured triangular meshes p 81 N88-12469

DISPERSING

Aircraft engine exhaust plume dynamics
[AD-A184238] p 100 N88-12488

DISPLAY DEVICES

Utilities systems management - Flying demonstrator
[SAE PAPER 860851] p 115 A88-15585

- Flight simulator visual systems p 105 A88-16680
 MBB simulation facilities applied for rotorcraft research p 106 N88-11655
 The flight evaluation of an advanced engine display and monitoring system p 97 N88-11659
 Helicopter (performance) management p 95 N88-11666
 Effects of combining vertical and horizontal information into a primary flight display [NASA-TP-2783] p 98 N88-12487
- DITCHING (LANDING)**
 H-46 helicopter emergency flotation system (HEFS) p 83 A88-13397
- DOMAINS**
 Modeling XV-15 tilt-rotor aircraft dynamics by frequency and time-domain identification techniques p 94 N88-11657
- DRAG**
 Effect of acoustic excitation on the flow over a low-Re airfoil p 75 A88-14459
- DRAG COEFFICIENTS**
 An experimental evaluation of advanced rotorcraft airfoils in the NASA Ames eleven-foot transonic wind tunnel [NASA-CR-166587] p 79 N88-11640
- DRAG REDUCTION**
 An experimental investigation of wing/fuselage integration geometries [AIAA PAPER 87-2937] p 74 A88-14278
 Investigations on a transonic airfoil with a 30 mm wide perforation/cavity arrangement [ESA-TT-1072] p 79 N88-11634
- DRAINAGE**
 Open-graded bases for airfield pavements [AD-A184461] p 108 N88-12500
- DROP TESTS**
 Study of aeropropulsion laboratory pressure drop rig and recommended test procedure [AD-A184333] p 117 N88-12038
- DROPS (LIQUIDS)**
 Experimental evidence for modifying the current physical model for ice accretion on aircraft surfaces [NASA-TM-87184] p 85 N88-12473
- DUCTED FAN ENGINES**
 Ducted fan noise propagation in non-uniform flow. I - Test background and simplified model [AIAA PAPER 87-2701] p 124 A88-16553
- DURABILITY**
 Probabilistic durability analysis methods for metallic airframes p 113 A88-14925
- DYNAMIC CHARACTERISTICS**
 Hovering helicopter flight dynamics: A study of vertical motion [AR-004-526] p 96 N88-12485
- DYNAMIC MODELS**
 Reduced order variable structure control of the lateral motion of an aircraft p 101 A88-14939
- DYNAMIC PRESSURE**
 Thrust savings limitations with blown high lift wings [AIAA PAPER 87-2884] p 89 A88-14262
- DYNAMIC RESPONSE**
 The influence of unsteady aerodynamic forces on dynamic response of a variable sweep aircraft p 101 A88-14018
 Reduced order variable structure control of the lateral motion of an aircraft p 101 A88-14939
 Stochastic modal interaction in linear and nonlinear aeroelastic structures p 116 A88-16435
 Response of stiffened panels for applications to acoustic fatigue [AIAA PAPER 87-2711] p 116 A88-16560
 An experimental investigation of dynamic ground effect [NASA-CR-4105] p 80 N88-12458
 A method for the efficient calculation of elastic rotor blade dynamic response in forward flight p 80 N88-12460
 Aircraft dynamic response calculation based on discrete-continual model p 104 N88-12624
- DYNAMIC STRUCTURAL ANALYSIS**
 Vibration analysis of flat skin-stringer structures by the super matrix method [AIAA PAPER 87-2734] p 116 A88-16573
 Aircraft interior noise reduction by alternate resonance tuning [NASA-CR-181530] p 127 N88-13005
- DYNAMIC TESTS**
 An advanced system for processing dynamic test data [AIAA PAPER 87-2687] p 105 A88-16543
- E**
- EARLY WARNING SYSTEMS**
 Airships face a military future p 83 A88-14050
- Maritime missions using an integrated LTA role p 84 A88-16660
- EDUCATION**
 Using microcomputers and specialized software to enhance aircraft design education [AIAA PAPER 87-2866] p 120 A88-14255
 Aircraft design education at the Royal Military College of Science Shrinvenham (CIT) and Kingston Polytechnic [AIAA PAPER 87-2867] p 127 A88-14256
 Aircraft design education in Chile [AIAA PAPER 87-2869] p 127 A88-14257
- EJECTION SEATS**
 The CREST system design --- ejection seat for USAF p 87 A88-13381
 The CREST seat structure development p 87 A88-13383
 The CREST windblast protection system design p 87 A88-13384
 Space Shuttle Orbiter ejection seat survey p 108 A88-13390
 Introducing the Mk15 ejection seat p 87 A88-13391
 CREST flight controller --- for ejection seat p 88 A88-13394
 NACES - The program and the seat --- Navy Aircrew Common Ejection Seat p 88 A88-13395
 Challenges of developing controllable propulsion for the Crew Escape Technologies (CREST) seat p 88 A88-13399
 Dealing with the problem of delayed ejections p 83 A88-13403
 NACES P31 and beyond --- Navy Aircrew Common Ejection Seat - PrePlanned Product Improvement p 88 A88-13539
- ELASTIC CYLINDERS**
 Active control of sound fields in elastic cylinders by multi-control forces [AIAA PAPER 87-2707] p 124 A88-16559
- ELASTIC PROPERTIES**
 A method for the efficient calculation of elastic rotor blade dynamic response in forward flight p 80 N88-12460
- ELASTIC SYSTEMS**
 An approximate approach to estimate the dynamic characteristics of aeroelastic system p 115 A88-16344
- ELECTRIC CURRENT**
 A heater made from graphite composite material for potential deicing application p 92 A88-15724
- ELECTROMAGNETIC FIELDS**
 Charge simulation method for the calculation of electromagnetic fields radiated from lightning p 119 A88-13261
- ELECTROMAGNETIC INTERFERENCE**
 Experimental and analytic studies of the triggered lightning environment of the F106B [NASA-CR-4104] p 119 N88-12897
- ELECTRONIC CONTROL**
 TM 333 and TM 319 turboshafts - Two new powerplants for helicopters p 99 A88-16729
 RTM322 electronic control and anticipated developments p 99 A88-16732
 TM 319 and TM 333 electronic control design and operational features p 99 A88-16733
 Engine/airframe response evaluation of the HH-60A helicopter equipped with the T700-GE-701 transient droop improvement electronic control unit [AD-A184443] p 103 N88-12492
- ELECTRONIC MODULES**
 The development of a standard electronic module with MIL-STD-1750A capabilities [SAE PAPER 860838] p 114 A88-15578
- ELECTRONIC PACKAGING**
 Heat removal key to shrinking avionics p 117 A88-16747
- EMERGENCIES**
 The development of emergency parachute systems for the Voyager world flight p 83 A88-13385
- ENGINE AIRFRAME INTEGRATION**
 Aerodynamic integration of aft-mounted UHB propulsion systems --- Ultra High Bypass [AIAA PAPER 87-2920] p 89 A88-14269
- ENGINE CONTROL**
 The value of early flight evaluation of propulsion concepts using the NASA F-15 research airplane [AIAA PAPER 87-2877] p 89 A88-14258
 Utilities systems management - Flying demonstrator [SAE PAPER 860851] p 115 A88-15585
 RTM322 electronic control and anticipated developments p 99 A88-16732
 A heat transfer model for a heated helium airship [AD-A183786] p 78 N88-11629
 The flight evaluation of an advanced engine display and monitoring system p 97 N88-11659
- Engine/airframe response evaluation of the HH-60A helicopter equipped with the T700-GE-701 transient droop improvement electronic control unit [AD-A184443] p 103 N88-12492
- ENGINE DESIGN**
 Three-dimensional photoelastic analysis of aeroengine rotary parts p 114 A88-15145
 Design of three-dimensional scramjet inlets for hypersonic propulsion p 76 A88-15501
 MTM385 engine p 99 A88-16730
 The RTM 322 turboshaft engine p 99 A88-16731
- ENGINE MONITORING INSTRUMENTS**
 Uncertainty of in-flight thrust determination [SAE AIR 1678] p 92 A88-15228
- ENGINE NOISE**
 A reflection mechanism for aft fan tone noise from turbofan engines [AIAA PAPER 87-2699] p 124 A88-16551
 Ducted fan noise propagation in non-uniform flow. I - Test background and simplified model [AIAA PAPER 87-2701] p 124 A88-16553
 Aeroacoustics of subsonic turbulent shear flows [AIAA PAPER 87-2731] p 125 A88-16571
- ENGINE PARTS**
 Shape optimization utilizing a boundary element formulation p 111 A88-13281
 Three-dimensional photoelastic analysis of aeroengine rotary parts p 114 A88-15145
 Airworthiness requirements for new engine ratings for helicopters p 100 A88-16734
 Composite mechanics for engine structures [NASA-TM-100176] p 111 N88-12552
- ENGINE STARTERS**
 Failure analyses of steel breech chambers used with aircraft cartridge ignition starters p 113 A88-15114
- ENGINE TESTS**
 Airworthiness requirements for new engine ratings for helicopters p 100 A88-16734
 Test stand performance of a convertible engine for advanced V/STOL and rotorcraft propulsion [NASA-TM-100211] p 100 N88-11679
 Performance and combustion characteristics of direct-injection stratified-charge rotary engines [NASA-TM-100134] p 100 N88-12490
- EQUATIONS OF MOTION**
 Improvements to the adaptive maneuvering logic program [NASA-CR-3985] p 93 N88-11648
 A method for the efficient calculation of elastic rotor blade dynamic response in forward flight p 80 N88-12460
 Aircraft dynamic response calculation based on discrete-continual model p 104 N88-12624
 Local-optimal control in systems with delay p 104 N88-12627
- EQUIPMENT SPECIFICATIONS**
 Aircraft equipment systems --- Russian book p 92 A88-15648
- EROSION**
 The ability of modified pavement quality concrete to resist ground erosion caused by VTOL aircraft [BAE-ARG-238] p 107 N88-11683
- ERROR ANALYSIS**
 Fault detection - Diagnosis and predictive maintenance --- application: jet engines p 98 A88-15032
 A critical assessment of wind tunnel results for the NACA 0012 airfoil [NASA-TM-100019] p 79 N88-11636
- ERROR DETECTION CODES**
 Fault detection - Diagnosis and predictive maintenance --- application: jet engines p 98 A88-15032
- ESCAPE SYSTEMS**
 The development of emergency parachute systems for the Voyager world flight p 83 A88-13385
 Koch emergency egress lighting systems for adverse optical conditions for military and commercial aircraft and other applications p 83 A88-13388
 Space Shuttle Orbiter ejection seat survey p 108 A88-13390
 CREST flight controller --- for ejection seat p 88 A88-13394
 Challenges of developing controllable propulsion for the Crew Escape Technologies (CREST) seat p 88 A88-13399
 Dealing with the problem of delayed ejections p 83 A88-13403
 Laser fiber optic initiation system p 109 A88-13407
 NACES P31 and beyond --- Navy Aircrew Common Ejection Seat - PrePlanned Product Improvement p 88 A88-13539
- EULER EQUATIONS OF MOTION**
 Numerical solutions of the Euler equations for the flow field around counter-rotating propellers p 70 A88-13544

- Application of Runge Kutta time marching scheme for the computation of transonic flows in turbomachines
[NASA-TM-86997] p 81 N88-12461
- Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 N88-12469

EVALUATION

- An evaluation plan of bus architectures and protocols using the NASA Ames intelligent redundant actuation system
[NASA-CR-177458] p 96 N88-12482

EXCITATION

- Excitation of natural oscillations of a boundary layer by an external acoustic field p 118 N88-12634

EXERCISE PHYSIOLOGY

- Flight research with the MIT Daedalus prototype
[SAE PAPER 87-1350] p 91 A88-14373

EXHAUST SYSTEMS

- High Mach propulsion system installation and exhaust system design considerations
[AIAA PAPER 87-2941] p 98 A88-14279

EXPERIMENTAL DESIGN

- Experimental use of artificial intelligence for (future) ATC systems
[PB87-106449] p 121 N88-12970

EXPERT SYSTEMS

- An evaluation plan of bus architectures and protocols using the NASA Ames intelligent redundant actuation system
[NASA-CR-177458] p 96 N88-12482
- Experimental use of artificial intelligence for (future) ATC systems
[PB87-106449] p 121 N88-12970

EXPLOSIONS

- Aircraft fire safety research p 85 N88-12526

F**F-106 AIRCRAFT**

- An experimental investigation of dynamic ground effect
[NASA-CR-4105] p 80 N88-12458
- Experimental and analytic studies of the triggered lightning environment of the F106B
[NASA-CR-4104] p 119 N88-12897

F-14 AIRCRAFT

- Effects of jet exhaust yaw vane installation and operation on the longitudinal and lateral-directional characteristics of the F-14 airplane
[NASA-TP-2769] p 80 N88-12455

F-15 AIRCRAFT

- The value of early flight evaluation of propulsion concepts using the NASA F-15 research airplane
[AIAA PAPER 87-2877] p 89 A88-14258
- Analysis of twin supersonic plume resonance
[AIAA PAPER 87-2895] p 123 A88-16550

F-16 AIRCRAFT

- Program management of the F-16 program
[AIAA PAPER 87-2962] p 127 A88-14286
- Application of robust direct adaptive control to the longitudinal dynamics of a fighter aircraft p 102 A88-14978

FABRICATION

- Automated fabrication of graphite-epoxy composites p 109 A88-13220

FABRICS

- An overview of fire blocking fabrics p 109 A88-13225

FAILURE ANALYSIS

- Observers for failure detection of actuation systems p 113 A88-14536
- Analyzing failures: The problems and the solutions p 113 A88-15113
- Failure analyses of steel breech chambers used with aircraft cartridge ignition starters p 113 A88-15114
- The analysis of aircraft component failures p 65 A88-15116

- Fatigue life: Analysis and prediction p 114 A88-15118

- Multiple-mode large deflection random response of beams with nonlinear damping subjected to acoustic excitation
[AIAA PAPER 87-2712] p 116 A88-16561

- Analysis of 7- X 10-foot high speed wind tunnel shaft loads in support of fan blade failure investigation
[NASA-TM-100504] p 107 N88-12496
- Failure analysis of composite structure materials
[AD-A184468] p 110 N88-12548

FALSE ALARMS

- Observers for failure detection of actuation systems p 113 A88-14536

FAN BLADES

- Detection of fan acoustic mode
[AIAA PAPER 87-2700] p 124 A88-16552

- Analysis of 7- X 10-foot high speed wind tunnel shaft loads in support of fan blade failure investigation
[NASA-TM-100504] p 107 N88-12496

FATIGUE (MATERIALS)

- Operational load measurements on service helicopters p 94 N88-11658

FATIGUE LIFE

- Fatigue life: Analysis and prediction p 114 A88-15118

- The effects of prestress on low cycle fatigue and fatigue crack growth behaviours for alloy GH33A p 110 A88-16331

- Operational load measurements on service helicopters p 94 N88-11658

FATIGUE TESTS

- The effects of prestress on low cycle fatigue and fatigue crack growth behaviours for alloy GH33A p 110 A88-16331

FAULT TOLERANCE

- Design and validation of fault-tolerant flight systems
[AIAA PAPER 87-2923] p 120 A88-14271

- An overview of SAE AE-9B high speed ring bus (HSRB) performance
[SAE PAPER 860844] p 115 A88-15583

- RTM322 electronic control and anticipated developments p 99 A88-16732

FEASIBILITY ANALYSIS

- RPV carrying airships p 64 A88-14312

- The passenger potential of airships p 84 A88-14314

FEEDBACK CONTROL

- Future directions in L(infinity) robust control theory p 121 A88-14945

- Study of the effects of discretizing quantitative feedback theory analog control system designs --- for transport and fighter aircraft p 102 A88-15033

- Active control of helicopter vibration using multiloop self-adaptive control p 103 N88-11660

FIBER COMPOSITES

- A heater made from graphite composite material for potential deicing application p 92 A88-15724

FIBER OPTICS

- Laser fiber optic initiation system p 109 A88-13407

- An inexpensive real-time interactive three-dimensional flight simulation system
[AD-A184340] p 107 N88-12499

FIBER ORIENTATION

- Fiber form/pressure molding processing for aircraft fuselage substructure p 108 A88-13138

FIBER REINFORCED COMPOSITES

- The ability of modified pavement quality concrete to resist ground erosion caused by VTOL aircraft
[BAE-ARG-238] p 107 N88-11683

FIGHTER AIRCRAFT

- Integrating nonlinear aerodynamic and structural analysis for a complete fighter configuration
[AIAA PAPER 87-2863] p 88 A88-14252

- Flight control synthesis to meet flying qualities specifications - An evaluation of multivariable synthesis techniques
[AIAA PAPER 87-2880] p 101 A88-14260

- Integration of manned simulation and flight test in an operational test and evaluation program
[AIAA PAPER 87-2924] p 105 A88-14272

- The experimental aircraft programme
[SAE PAPER 871347] p 64 A88-14371

- A decoupling approach to the design of the two-degree-of-freedom tracking control systems --- for fighter aircraft p 102 A88-14961

- Application of robust direct adaptive control to the longitudinal dynamics of a fighter aircraft p 102 A88-14978

- Aircraft/stores data bus networks
[SAE PAPER 860842] p 115 A88-15581

FREE VIBRATION

The vertical test section (VMK) of DFVLR in Cologne-Forz, Federal Republic of Germany (status 1986)

[ESA-TT-1053] p 107 N88-11682

FREE VIBRATION

Free vibration of conical shell panels

p 112 A88-13940

Free vibration characteristics of damped sandwich panel

stiffened with damped stringers p 112 A88-13965

FREEZING

Experimental evidence for modifying the current physical

model for ice accretion on aircraft surfaces

[NASA-TM-87184] p 85 N88-12473

FREQUENCIES

Modeling XV-15 tilt-rotor aircraft dynamics by frequency

and time-domain identification techniques

p 94 N88-11657

FREQUENCY MODULATION

Multiple-mode large deflection random response of

beams with nonlinear damping subjected to acoustic

excitation

[AIAA PAPER 87-2712] p 116 A88-16561

FREQUENCY RESPONSE

The calibration and operation of a constant-temperature

crossed-wire probe in supersonic flow

p 113 A88-14175

FREQUENCY REUSE

Planning of advanced maritime and aeronautical mobile

satellite system with multibeam frequency re-use

[IAF PAPER 87-480] p 86 A88-16126

FRICTION DRAG

The calculation of aerotail friction drag in compressibility

viscous flow

p 71 A88-14023

FUEL CONSUMPTION

The B. Ae. Hawk - A first decade of development

[AIAA PAPER 87-2911] p 89 A88-14266

Aeronautical developments for the 21st century

[AIAA PAPER 87-3052] p 65 A88-14878

TM 333 and TM 319 turboshafts - Two new powerplants

for helicopters p 99 A88-16729

MTM385 engine p 99 A88-16730

FUEL CONTROL

Utilities systems management - Flying demonstrator

[SAE PAPER 860851] p 115 A88-15585

TM 333 and TM 319 turboshafts - Two new powerplants

for helicopters p 99 A88-16729

Application of a fuzzy controller in fuel system of turbojet

engine p 100 A88-16902

FUEL INJECTION

Hydrogen scramjet with side wall injection

p 99 A88-15527

Performance and combustion characteristics

of direct-injection stratified-charge rotary engines

[NASA-TM-100134] p 100 N88-12490

FUEL SYSTEMS

Aircraft fire safety research

p 85 N88-12526

FUEL TANKS

MD-11 design - Evolution, not revolution

[AIAA PAPER 87-2928] p 90 A88-14274

FUSELAGES

Fiber form/pressure molding processing for aircraft

fuselage substructure p 108 A88-13138

Fuselage self-propulsion by static-pressure thrust -

Wind-tunnel verification

[AIAA PAPER 87-2935] p 90 A88-14276

An experimental investigation of wing/fuselage

integration geometries

[AIAA PAPER 87-2937] p 74 A88-14278

The design of a joined wing flight demonstrator

aircraft

[AIAA PAPER 87-2930] p 93 A88-16475

Mechanisms of active control in cylindrical fuselage

structures

[AIAA PAPER 87-2703] p 102 A88-16555

Controlling the dynamic environment during NOE flight

p 103 N88-11661

A 0.15-scale study of configuration effects on the

aerodynamic interaction between main rotor and

fuselage

[NASA-CR-166577] p 81 N88-12462

FUZZY SETS

Application of a fuzzy controller in fuel system of turbojet

engine p 100 A88-16902

G

GAS DYNAMICS

Some asymptotic modes of transonic vortex flow

p 82 N88-12632

GAS FLOW

Conical wing with maximum lift-to-drag ratio in

supersonic gas flow

p 82 N88-12633

GAS TURBINE ENGINES

Progress toward life modeling of thermal barrier coatings

for aircraft gas turbine engines

[ASME PAPER 87-ICE-18] p 110 A88-15120

Three-dimensional photoelastic analysis of aeroengine

rotary parts p 114 A88-15145

Composite mechanics for engine structures

[NASA-TM-100176] p 111 N88-12552

GAS TURBINES

High Mach propulsion system installation and exhaust

system design considerations

[AIAA PAPER 87-2941] p 98 A88-14279

GENERAL AVIATION AIRCRAFT

Technical thresholds for revitalizing general aviation

[AIAA PAPER 87-2933] p 63 A88-14275

The impact of product liability litigation on the aviation

community - A general aviation aircraft manufacturer's

view

[SAE PAPER 871329] p 128 A88-14361

A low cost flight simulator for twin-engined general

aircraft p 106 A88-16686

Semiempirical method for prediction of aerodynamic

forces and moments on a steadily spinning light airplane

[NASA-TM-4009] p 80 N88-12456

GEOMETRIC DILUTION OF PRECISION

GPS vertical axis performance enhancement for

helicopter precision landing approach

[NASA-CR-177443] p 86 N88-12477

GLOBAL POSITIONING SYSTEM

High dynamic GPS receiver using maximum likelihood

estimation and frequency tracking

p 86 A88-15360

GPS vertical axis performance enhancement for

helicopter precision landing approach

[NASA-CR-177443] p 86 N88-12477

GOERTLER INSTABILITY

The Goertler instability on an airfoil

[AIAA PAPER 85-0491] p 75 A88-14848

GOVERNMENT PROCUREMENT

NACES - The program and the seat - Navy Aircrew

Common Ejection Seat p 88 A88-13395

GOVERNMENT/INDUSTRY RELATIONS

The experimental aircraft programme

[SAE PAPER 871347] p 64 A88-14371

Technology challenges for the National Aero-Space

Plane

[IAF PAPER 87-205] p 92 A88-15938

GRAPHITE-EPOXY COMPOSITES

Automated fabrication of graphite-epoxy composites

p 109 A88-13220

A heater made from graphite composite material for

potential deicing application

p 92 A88-15724

GROUND EFFECT (AERODYNAMICS)

An investigation of the structure of a ground-trailing

vortex

p 112 A88-14019

An experimental investigation of dynamic ground

effect

[NASA-CR-4105] p 80 N88-12458

GROUND EFFECT (COMMUNICATIONS)

The influence of helicopter flight parameters on the

results of measurements of horizontal radiation patterns

of VHF/UHF broadcasting antennae p 86 A88-16708

GUIDE VANES

Test stand performance of a convertible engine for

advanced V/STOL and rotorcraft propulsion

[NASA-TM-100211] p 100 N88-11679

GUST LOADS

Prediction of gust loadings and alleviation at transonic

speeds p 77 A88-15721

H

HARMONIC CONTROL

Analytic investigation of helicopter rotor blade appended

aeroelastic devices

[NASA-CR-166525] p 95 N88-11676

HARMONIC OSCILLATION

An unsteady lifting-line theory

p 71 A88-13957

HEAT EXCHANGERS

Eddy generation in heat conductors

p 112 A88-13427

Measured performance of the heat exchanger in the

NASA icing research tunnel under severe icing and dry-air

conditions

[NASA-TM-100116] p 118 N88-12796

HEAT MEASUREMENT

A study of a multi-layered thin film heat transfer gauge

and a new method of measuring heat transfer rate with

it p 113 A88-14248

HEAT PIPES

Heat removal key to shrinking avionics

p 117 A88-16747

HEAT TRANSFER

Jet impingement heat transfer - A literature survey -

for aircraft deicing systems

[ASME PAPER 87-HT-35] p 116 A88-16586

A heat transfer model for a heated helium airship

[AD-A183786] p 78 N88-11629

HEAT TREATMENT

Stress corrosion cracking of 4340 steel in aircraft ignition

starter residues p 109 A88-15106

HEATERS

A heater made from graphite composite material for

potential deicing application

p 92 A88-15724

HEAVY LIFT AIRSHIPS

Toroidal balloon concept

The Dynairship - A lifting body airship for cargo

p 65 A88-16652

The Cyclo-Crane - An LTA hybrid success story

p 66 A88-16653

Aerial logging --- by airships cranes

p 66 A88-16655

HELICOPTER CONTROL

Engine/airframe response evaluation of the HH-60A

helicopter equipped with the T700-GE-701 transient droop

improvement electronic control unit

[AD-A184443] p 103 N88-12492

HELICOPTER DESIGN

A practical helicopter cabin noise simulator

p 106 A88-16681

Results of the 1986 NASA/FAA/DFVLR main rotor test

entry in the German-Dutch wind tunnel (DNW)

[NASA-TM-100507] p 127 N88-13003

HELICOPTER ENGINES

New developments of European powerplants for

helicopters; Proceedings of the Symposium, London,

England, Oct. 21, 1986

p 99 A88-16728

TM 333 and TM 319 turboshafts - Two new powerplants

for helicopters p 99 A88-16729

MTM385 engine p 99 A88-16730

RTM322 electronic control and anticipated

developments p 99 A88-16732

TM 319 and TM 333 electronic control design and

operational features p 99 A88-16733

Airworthiness requirements for new engine ratings for

helicopters p 100 A88-16734

HELICOPTER PERFORMANCE

The influence of helicopter flight parameters on the

results of measurements of horizontal radiation patterns

of VHF/UHF broadcasting antennae p 86 A88-16708

Engine/airframe response evaluation of the HH-60A

helicopter equipped with the T700-GE-701 transient droop

improvement electronic control unit

[AD-A184443] p 103 N88-12492

HELICOPTER TAIL ROTORS

The prediction of helicopter tail rotor noise on the flight

path

[AIAA PAPER 87-2747] p 126 A88-16581

HELICOPTER WAKES

Rotor blade-vortex interaction impulsive noise source

identification and correlation with rotor wake predictions

[AIAA PAPER 87-2744] p 126 A88-16580

HELICOPTERS

H-46 helicopter emergency flotation system (HEFS)

p 83 A88-13397

Rotorcraft Design for Operations

[AGARD-CP-423] p 94 N88-11649

Design requirements for future commercial operations

p 94 N88-11651

Mission-oriented flying qualities criteria for helicopter

KNUDSEN FLOW

Numerical studies on rarefied flow over a flat plate at an angle of attack p 78 A88-16852

L

LAMINAR BOUNDARY LAYER

Pressure wave-boundary layer interaction p 112 A88-13440

Flow development on a Joukowski airfoil started impulsively from rest p 74 A88-14164

Excitation of natural oscillations of a boundary layer by an external acoustic field p 118 N88-12634

LAMINAR FLOW

Performance of a three-dimensional Navier-Stokes code on CYBER 205 for high-speed junction flows p 72 A88-14108

Numerical study of the entrance flow and its transition in a circular pipe (2) p 117 N88-12011

LAMINAR FLOW AIRFOILS

Stability analysis as an aid in the design of laminar profiles p 70 A88-13437

LANDING

Effect of motion cues during complex curved approach and landing tasks: A piloted simulation study [NASA-TP-2773] p 96 N88-12480

LAPLACE EQUATION

A high order panel method for determining incompressible flows around arbitrary bodies p 68 A88-13267

LASER ANEMOMETERS

Three-dimensional calculation in high subsonic axial compressor rotor and its comparison with L2F velocity measurement p 117 N88-11886

LASER APPLICATIONS

Laser fiber optic initiation system p 109 A88-13407

LATERAL CONTROL

Reduced order variable structure control of the lateral motion of an aircraft p 101 A88-14939

LATERAL STABILITY

Effects of jet exhaust yaw vane installation and operation on the longitudinal and lateral-directional characteristics of the F-14 airplane p 80 N88-12455

[NASA-TP-2769] p 80 N88-12455

LAY-UP

Fiber form/pressure molding processing for aircraft fuselage substructure p 108 A88-13138

LEADING EDGE SWEEP

Transition on swept leading edges at Mach 3.5 p 77 A88-15722

LEGAL LIABILITY

Transport aircraft safety - An aviation community commitment [SAE PAPER 871328] p 128 A88-14360

LENTICULAR BODIES

The Hyster Aerodyne airship p 66 A88-16659

LIABILITIES

The impact of product liability litigation on the aviation community - A general aviation aircraft manufacturer's view [SAE PAPER 871329] p 128 A88-14361

The impact of product liability on aviation development [SAE PAPER 871330] p 128 A88-14362

LIFE (DURABILITY)

Progress toward life modeling of thermal barrier coatings for aircraft gas turbine engines [ASME PAPER 87-ICE-18] p 110 A88-15120

Airworthiness of long-life jet transport structures p 95 N88-11674

LIFE CYCLE COSTS

MTM385 engine p 99 A88-16730

LIFT

Zero-lift drag predictions in supersonic flow for complex configurations p 71 A88-14021

Airship lift - Static, dynamic and powered static p 75 A88-14306

Effect of acoustic excitation on the flow over a low-Re airfoil p 75 A88-14459

Lift-curve characteristics for an airfoil pitching at constant rate p 76 A88-15718

A heat transfer model for a heated helium airship [AD-A183786] p 78 N88-11629

An experimental evaluation of advanced rotorcraft airfoils in the NASA Ames eleven-foot transonic wind tunnel [NASA-CR-166587] p 79 N88-11640

Aerodynamic sensitivities from subsonic, sonic and supersonic unsteady, nonplanar lifting-surface theory [NASA-TM-100502] p 80 N88-12459

LIFT AUGMENTATION

Thrust savings limitations with blown high lift wings [AIAA PAPER 87-2884] p 89 A88-14262

LIFT DEVICES

Aircraft dynamic response calculation based on discrete-continual model p 104 N88-12624

LIFT DRAG RATIO

Conical wing with maximum lift-to-drag ratio in supersonic gas flow p 82 N88-12633

LIGHT AIRCRAFT

Composite structures in homebuilt sport aircraft p 109 A88-13235

The development of emergency parachute systems for the Voyager world flight p 83 A88-13385

The design, development and construction of the UM10 ultralight non-rigid airship p 90 A88-14305

Light aircraft sound transmission studies - Noise reduction model p 92 A88-16471

LIGHTING EQUIPMENT

Koch emergency egress lighting systems for adverse optical conditions for military and commercial aircraft and other applications p 83 A88-13388

LIGHTNING

Charge simulation method for the calculation of electromagnetic fields radiated from lightning p 119 A88-13261

Experimental and analytic studies of the triggered lightning environment of the F106B [NASA-CR-4104] p 119 N88-12897

LINEAR SYSTEMS

Stochastic modal interaction in linear and nonlinear aeroelastic structures p 116 A88-16435

LOADS (FORCES)

Development of maneuver loads spectrum for X-type aircraft p 102 A88-16342

Operational load measurements on service helicopters p 94 N88-11658

LOCAL AREA NETWORKS

Applications of the hybrid automated reliability predictor [NASA-TP-2760] p 121 N88-12928

LOGGING (INDUSTRY)

Aerial logging --- by airships cranes p 66 A88-16655

LOGIC PROGRAMMING

Improvements to the adaptive maneuvering logic program [NASA-CR-3985] p 93 N88-11648

LONGITUDINAL CONTROL

Flight control of an X-29 type aircraft via a combination of LQ optimization techniques p 101 A88-14960

A decoupling approach to the design of the two-degree-of-freedom tracking control systems --- for fighter aircraft p 102 A88-14961

Application of robust direct adaptive control to the longitudinal dynamics of a fighter aircraft p 102 A88-14978

LONGITUDINAL STABILITY

Experimental investigation on longitudinal characteristics of the forward swept wing p 77 A88-16336

Effects of jet exhaust yaw vane installation and operation on the longitudinal and lateral-directional characteristics of the F-14 airplane [NASA-TP-2769] p 80 N88-12455

LOW COST

An update on the dual-stage test procedure for low-cost measurement of parachute performance p 83 A88-13408

LOW REYNOLDS NUMBER

Unsteady separation at low Reynolds numbers p 73 A88-14150

Details of the computed flowfield over a circular cylinder at Reynolds number 1200 p 73 A88-14159

Effect of acoustic excitation on the flow over a low-Re airfoil p 75 A88-14459

Viscous-inviscid analysis of transonic and low Reynolds number airfoils p 76 A88-15710

LOW WEIGHT

L.W. SKAD (light weight survival kit air droppable) development program p 83 A88-13410

The design, development and construction of the UM10 ultralight non-rigid airship p 90 A88-14305

M

MACH NUMBER

Stability analysis as an aid in the design of laminar profiles p 70 A88-13437

High Mach propulsion system installation and exhaust system design considerations [AIAA PAPER 87-2941] p 98 A88-14279

A reflection mechanism for aft fan tone noise from turbofan engines [AIAA PAPER 87-2699] p 124 A88-16551

An experimental investigation of the coherent structure in an incompressible jet [AIAA PAPER 87-2715] p 124 A88-16563

Numerical studies on rarefied flow over a flat plate at an angle of attack p 78 A88-16852

MAGNETIC SUSPENSION

Stabilization of precession-free rotors supported by magnets p 111 A88-13342

MAGNETS

Stabilization of precession-free rotors supported by magnets p 111 A88-13342

MAINTAINABILITY

Field repair compounds for thermoset and thermoplastic composites p 108 A88-13148

MAINTENANCE

Airworthiness of long-life jet transport structures p 95 N88-11674

MAN POWERED AIRCRAFT

Flight research with the MIT Daedalus prototype [SAE PAPER 871350] p 91 A88-14373

MANAGEMENT PLANNING

Real-time operational planning for the U.S. air traffic system p 119 A88-13926

Experimental use of artificial intelligence for (future) ATC systems [PB87-106449] p 121 N88-12970

MANUFACTURING

Airworthiness of long-life jet transport structures p 95 N88-11674

Status of titanium alloys R and D described p 110 N88-11876

MARECS MARITIME SATELLITES

A conformal aircraft phased array antenna for airplane-satellite communication in the L band [ESA-TT-1057] p 117 N88-11926

MARITIME SATELLITES

Planning of advanced maritime and aeronautical mobile satellite system with multibeam frequency re-use [IAF PAPER 87-480] p 86 A88-16126

MARKETING

Technical thresholds for revitalizing general aviation [AIAA PAPER 87-2933] p 63 A88-14275

Airships in the market place p 66 A88-16657

The RTM 322 turboshaft engine p 99 A88-16731

MARKOV PROCESSES

Overlooked potential of systems with Markovian coefficients --- for tracking of maneuvering aircraft p 86 A88-15051

MASS

Effect of permissible variations of center-of-gravity locations of cargo airplane on its mass p 97 N88-12625

MATHEMATICAL MODELS

The Shock and Vibration Digest, Volume 19, No. 11 p 95 N88-11673

A hybrid numerical technique for predicting the aerodynamic and acoustic fields of advanced turboprops [NASA-CR-174926] p 126 N88-12352

Hovering helicopter flight dynamics: A study of vertical motion [AR-004-526] p 96 N88-12485

An integrated study of structures, aerodynamics and controls on the forward swept wing X-29A and the oblique wing research aircraft [NASA-CR-181548] p 96 N88-12486

Aircraft engine exhaust plume dynamics [AD-A184238] p 100 N88-12488

Aircraft dynamic response calculation based on discrete-continual model p 104 N88-12624

Experimental and analytic studies of the triggered lightning environment of the F106B [NASA-CR-4104] p 119 N88-12897

MATRIX METHODS

Vibration analysis of flat skin-stringer structures by the super matrix method [AIAA PAPER 87-2734] p 116 A88-16573

MAXIMUM LIKELIHOOD ESTIMATES

High dynamic GPS receiver using maximum likelihood estimation and frequency tracking p 86 A88-15380

MECHANICAL PROPERTIES

Status of titanium alloys R and D described p 110 N88-11876

Parachute materials [DE87-014845] p 110 N88-12550

MECHANICS (PHYSICS)

Structural mechanics of flight vehicles --- Russian book p 115 A88-15647

METAL FATIGUE

Probabilistic durability analysis methods for metallic airframes p 113 A88-14925

METAL FOILS

A heater made from graphite composite material for potential deicing application p 92 A88-15724

METAL MATRIX COMPOSITES

Development of particulate reinforced high strength aluminum alloy for aerospace applications p 109 A88-13198

MICROCOMPUTERS

Using microcomputers and specialized software to enhance aircraft design education [AIAA PAPER 87-2866] p 120 A88-14255

MICROPROCESSORS

- The on-line identification and its microprocessor realization of the equivalent systems of aircraft
p 102 A88-16335
- TM 319 and TM 333 electronic control design and operational features
p 99 A88-16733

MICROWAVE LANDING SYSTEMS

- Effect of motion cues during complex curved approach and landing tasks: A piloted simulation study
[NASA-TP-2773] p 96 N88-12480

MIDAIR COLLISIONS

- UK airmiss statistics
[CAP-530] p 85 N88-11642

p 95 N88-11672

MILITARY HELICOPTERS

- The influence of operational requirements on LHX concept formulation
p 94 N88-11650

- Investigation of vertical axis handling qualities for helicopter hover and NOE flight
p 103 N88-11653

- MBB simulation facilities applied for rotorcraft research
p 106 N88-11655

- Impacts of rotor hub design criteria on the operational capabilities of rotorcraft systems
p 94 N88-11663

- Helicopter (performance) management
p 95 N88-11666

- Helicopter fire control: Advantages of an automatic target tracker
p 106 N88-11667

- A129 advanced solutions for meeting today's combat helicopter requirement
p 95 N88-11669

MILITARY TECHNOLOGY

- A computer aided aircraft structural composite repair system
p 109 A88-13168

- Soviet aviation technology's state of the art SU-27 fighter
[AD-A184121] p 67 N88-11628

MISSILE CONFIGURATIONS

- Zero-lift drag predictions in supersonic flow for complex configurations
p 71 A88-14021

MISSION PLANNING

- Helicopter (performance) management
p 95 N88-11666

MOBILE COMMUNICATION SYSTEMS

- Planning of advanced maritime and aeronautical mobile satellite system with multibeam frequency re-use
[IAF PAPER 87-480] p 86 A88-16126

MODAL RESPONSE

- Detection of fan acoustic mode
[AIAA PAPER 87-2700] p 124 A88-16552

- Ducted fan noise propagation in non-uniform flow. I - Test background and simplified model
[AIAA PAPER 87-2701] p 124 A88-16553

MODELS

- A heat transfer model for a heated helium airship
[AD-A183786] p 78 N88-11629

- Reduced complexity structural modeling for automated airframe synthesis
[NASA-CR-177440] p 67 N88-12453
- Experimental evidence for modifying the current physical model for ice accretion on aircraft surfaces
[NASA-TM-87184] p 85 N88-12473

MOMENTS

- Semiempirical method for prediction of aerodynamic forces and moments on a steadily spinning light airplane
[NASA-TM-4009] p 80 N88-12456

MOTION

- Effect of motion cues during complex curved approach and landing tasks: A piloted simulation study
[NASA-TP-2773] p 96 N88-12480

MULTIPLEXING

- A129 advanced solutions for meeting today's combat helicopter requirement
p 95 N88-11669

N**NACELLES**

- A method to optimize nacelle shape in a supersonic cruise aircraft
[AIAA PAPER 87-2865] p 89 A88-14254
- Use of conformal mapping in grid generation for complex three-dimensional configurations
p 76 A88-15702

NAP-OF-THE-EARTH NAVIGATION

- Investigation of vertical axis handling qualities for helicopter hover and NOE flight
p 103 N88-11653
- Handling qualities criterion for very low visibility rotorcraft
p 103 N88-11654
- Some data processing requirements for precision Nap-Of-the-Earth (NOE) guidance and control of rotorcraft
[NASA-CR-177453] p 104 N88-12493

NASA PROGRAMS

- Aerospaceplane - NASA's flame rekindled
p 65 A88-16376

NATIONAL AEROSPACE PLANE PROGRAM

- Technology challenges for the National Aero-Space Plane
[IAF PAPER 87-205] p 92 A88-15938
- Aerospaceplane - NASA's flame rekindled
p 65 A88-16376

NAVIER-STOKES EQUATION

- Vectorizable implicit algorithms for the flux-difference split, three-dimensional Navier-Stokes equations
p 120 A88-14103

- Performance of a three-dimensional Navier-Stokes code on CYBER 205 for high-speed juncture flows
p 72 A88-14108

- Analysis of unsteady wake of a circular cylinder using Navier-Stokes equations
p 73 A88-14160

- Development and application of computational aerothermodynamics flowfield computer codes
[NASA-CR-181534] p 81 N88-12465

NAVY

- NACES - The program and the seat --- Navy Aircrew Common Ejection Seat
p 88 A88-13395

- NACES P31 and beyond --- Navy Aircrew Common Ejection Seat - PrePlanned Product Improvement
p 88 A88-13539

- The design challenge of a long endurance airship
p 64 A88-14309

NEUMANN PROBLEM

- A high order panel method for determining incompressible flows around arbitrary bodies
p 68 A88-13267

NEWTON THEORY

- Unsteady Newtonian flow over two-dimensional airfoils
p 74 A88-14246

NEWTONIAN FLUIDS

- Newtonian theory for the compression surface of airfoils at moderate or large incidence
p 76 A88-15701

NICKEL ALLOYS

- The effects of prestress on low cycle fatigue and fatigue crack growth behaviours for alloy GH33A
p 110 A88-16331

NOISE GENERATORS

- Flow-induced noise from wind tunnel turbulence reduction screens
[AIAA PAPER 87-2728] p 125 A88-16569

NOISE INTENSITY

- Measurement on acoustic source-strength distribution of coaxial jets
[AIAA PAPER 87-2716] p 124 A88-16564

NOISE MEASUREMENT

- Measurement on acoustic source-strength distribution of coaxial jets
[AIAA PAPER 87-2716] p 124 A88-16564

- Measurements of propeller noise in a light turboprop airplane
[AIAA PAPER 87-2737] p 93 A88-16575

NOISE PREDICTION (AIRCRAFT)

- Noise characteristics of model counter-rotating Prop-Fans
[AIAA PAPER 87-2656] p 122 A88-16526

- Noise prediction of counter rotation propeller
[AIAA PAPER 87-2658] p 122 A88-16527

- Models for evaluating the performance of propeller aircraft active noise control systems
[AIAA PAPER 87-2704] p 93 A88-16556

- Added noise due to the effect of an upstream wake on a propeller
[AIAA PAPER 87-2720] p 125 A88-16566

- The prediction of helicopter tail rotor noise on the flight path
[AIAA PAPER 87-2747] p 126 A88-16581

- Prediction of blade-vortex interaction noise using measured blade pressures
[AIAA PAPER 87-2749] p 126 A88-16582

- A practical helicopter cabin noise simulator
p 106 A88-16681

NOISE PROPAGATION

- Structure-borne noise transmission in stiffened structures
[AIAA PAPER 87-2679] p 123 A88-16540

- Ducted fan noise propagation in non-uniform flow. I - Test background and simplified model
[AIAA PAPER 87-2701] p 124 A88-16553

NOISE REDUCTION

- The active minimization of harmonic enclosed sound fields. I - Theory. II - A computer simulation. III - Experimental verification
p 122 A88-13936

- Light aircraft sound transmission studies - Noise reduction model
p 92 A88-16471

- Structure-borne noise control for propeller aircraft
[AIAA PAPER 87-2680] p 123 A88-16541

- Mechanisms of active control in cylindrical fuselage structures
[AIAA PAPER 87-2703] p 102 A88-16555

- Digital control of sound fields in three-dimensional enclosures --- noise level reduction in turboprop aircraft
[AIAA PAPER 87-2706] p 93 A88-16558

- Active control of sound fields in elastic cylinders by multi-control forces
[AIAA PAPER 87-2707] p 124 A88-16559

- Aircraft interior noise reduction by alternate resonance tuning
[NASA-CR-181530] p 127 N88-13005

NONDESTRUCTIVE TESTS

- Failure analysis of composite structure materials
[AD-A184468] p 110 N88-12548

NONLINEAR SYSTEMS

- A nonlinear, asymptotic investigation of the stationary modes of instability of the three-dimensional boundary layer on a rotating disc
p 114 A88-15455

- Stochastic modal interaction in linear and nonlinear aeroelastic structures
p 116 A88-16435

NONUNIFORM FLOW

- Ducted fan noise propagation in non-uniform flow. I - Test background and simplified model
[AIAA PAPER 87-2701] p 124 A88-16553

NOSE CONES

- Numerical study of supersonic flow around blunt bodies with extended needle nose
p 82 N88-12635

NOSE INLETS

- Computation of the compensation pitot tube in front of the nose inlet of an aircraft at transonic speed
p 77 A88-16341

NOZZLE EFFICIENCY

- High Mach propulsion system installation and exhaust system design considerations
[AIAA PAPER 87-2941] p 98 A88-14279

NOZZLE GEOMETRY

- Analysis of the performance of aerodynamically variable nozzle
p 77 A88-16339

- Nozzle geometry effects on supersonic jet interaction
[AIAA PAPER 87-2694] p 123 A88-16548

- Development and application of computational aerothermodynamics flowfield computer codes
[NASA-CR-181534] p 81 N88-12465

NUCLEAR RADIATION

- B-1B avionics system safety overview and approach
[SAE PAPER 860854] p 84 A88-15587

NUMERICAL ANALYSIS

- A numerical approach for on-line guidance of aircraft
p 102 A88-14965

- Analysis of the performance of aerodynamically variable nozzle
p 77 A88-16339

- Analytic investigation of helicopter rotor blade appended aeroelastic devices
[NASA-CR-166525] p 95 N88-11676

- Numerical study of the entrance flow and its transition in a circular pipe (2)
p 117 N88-12011

NUMERICAL CONTROL

- A geometry system for aerodynamic design
[AIAA PAPER 87-2902] p 120 A88-14265

NUMERICAL FLOW VISUALIZATION

- A numerical model for analysis of thin wings in inviscid incompressible flow p 68 A88-13121
- Flow field study on a 65 deg delta wing p 69 A88-13435
- Numerical simulation of self-sustained and forced oscillations in jet shear layers p 73 A88-14155
- Details of the computed flowfield over a circular cylinder at Reynolds number 1200 p 73 A88-14159
- Analysis of unsteady wake of a circular cylinder using Navier-Stokes equations p 73 A88-14160
- Numerical solution of non-stationary three-dimensional transonic flow over a thin body p 77 A88-16446

O

OBLIQUE SHOCK WAVES

- Diffraction of an oblique shock wave in the vicinity of an external right-angle corner p 70 A88-13741

OBLIQUE WINGS

- An integrated study of structures, aerodynamics and controls on the forward swept wing X-29A and the oblique wing research aircraft [NASA-CR-181548] p 96 N88-12486

OBSERVABILITY (SYSTEMS)

- Observers for failure detection of actuation systems p 113 A88-14536

ON-LINE PROGRAMMING

- The on-line identification and its microprocessor realization of the equivalent systems of aircraft p 102 A88-16335

OPTICAL RADAR

- The Avionics Flight Evaluation System (AFES) of the DFVLR [ESA-TT-1037] p 98 N88-11677

OPTIMAL CONTROL

- A numerical approach for on-line guidance of aircraft p 102 A88-14965
- Local-optimal control in systems with delay p 104 N88-12627

OPTIMIZATION

- Compromise - An effective approach for conceptual aircraft design [AIAA PAPER 87-2965] p 90 A88-14287
- Flight control of an X-29 type aircraft via a combination of LQ optimization techniques p 101 A88-14960
- Reduced complexity structural modeling for automated airframe synthesis [NASA-CR-177440] p 67 N88-12453

OSCILLATING FLOW

- Computations of a turbulent jet-edge flow field p 72 A88-14126
- Numerical simulation of self-sustained and forced oscillations in jet shear layers p 73 A88-14155
- Impulse wind tunnels --- Russian book p 76 A88-15676
- Analysis of twin supersonic plume resonance [AIAA PAPER 87-2695] p 123 A88-16550
- A supersonic potential gradient method for the calculation of unsteady aerodynamic pressures on harmonically oscillating wings [ESA-TT-930] p 79 N88-11631

OSCILLATIONS

- Excitation of natural oscillations of a boundary layer by an external acoustic field p 118 N88-12634
- Dynamics of reverse flows at pump inlet p 118 N88-12636

OXYGEN CONSUMPTION

- Flight research with the MIT Daedalus prototype [SAE PAPER 871350] p 91 A88-14373

P

PACIFIC OCEAN

- V/STOL aircraft configurations and opportunities in the Pacific Basin [NASA-TM-100005] p 85 N88-11644

PANEL METHOD (FLUID DYNAMICS)

- An assessment of the use of low-order panel methods for the calculation of supersonic flows p 67 A88-13119
- Aerodynamic analysis of complicated three-dimensional configurations using surface panel methods p 68 A88-13266
- A high order panel method for determining incompressible flows around arbitrary bodies p 68 A88-13267
- Constant pressure panel method for supersonic unsteady airload analysis p 77 A88-15720
- Response of stiffened panels for applications to acoustic fatigue [AIAA PAPER 87-2711] p 116 A88-16560

PARACHUTE FABRICS

- Parachute materials [DE87-014845] p 110 N88-12550

PARACHUTES

- The development of emergency parachute systems for the Voyager world flight p 83 A88-13385
- An update on the dual-stage test procedure for low-cost measurement of parachute performance p 83 A88-13408
- Developmental air-drop testing techniques and devices [AGARD-AG-300-VOL-6] p 96 N88-12481
- Parachute materials [DE87-014845] p 110 N88-12550

PARALLEL FLOW

- Nozzle geometry effects on supersonic jet interaction [AIAA PAPER 87-2694] p 123 A88-16548
- Some asymptotic modes of transonic vortex flow p 82 N88-12632

PARALLEL PROCESSING (COMPUTERS)

- Applications of parallel processing in fluid mechanics; Proceedings of the Applied Mechanics, Bioengineering, and Fluids Engineering Conference, Cincinnati, OH, June 14-17, 1987 p 119 A88-14101

PARAMETER IDENTIFICATION

- Modeling XV-15 tilt-rotor aircraft dynamics by frequency and time-domain identification techniques p 94 N88-11657

PARAMETERIZATION

- Local-optimal control in systems with delay p 104 N88-12627

PARTICLES

- Experimental and analytic studies of the triggered lightning environment of the F106B [NASA-CR-4104] p 119 N88-12897

PASSENGER AIRCRAFT

- An overview of fire blocking fabrics p 109 A88-13225
- Aircraft passenger protection from smoke and fire p 83 A88-13392
- Inclined planes --- tilt-rotor aircraft configurations p 88 A88-13973

- An airline philosophy to safety p 85 A88-16738
- Passengers and professionals - The safety partnership p 85 A88-16740

PATTERN RECOGNITION

- Geometry processing --- extraction of geometric features from already constructed curves or surfaces [AIAA PAPER 87-2898] p 120 A88-14264

PAVEMENTS

- The ability of modified pavement quality concrete to resist ground erosion caused by VTOL aircraft [BAE-ARG-238] p 107 N88-11683
- Open-graded bases for airfield pavements [AD-A184611] p 108 N88-12500

PERFORATED PLATES

- Acoustic and aerodynamic characteristics of Perforin, the linear perforated plate acoustic liner [AIAA PAPER 87-2740] p 125 A88-16576

PERFORMANCE PREDICTION

- Fault detection - Diagnosis and predictive maintenance --- application: jet engines p 98 A88-15032
- Fatigue life: Analysis and prediction p 114 A88-15118

- Analysis of the performance of aerodynamically variable nozzle p 77 A88-16339

- A hybrid numerical technique for predicting the aerodynamic and acoustic fields of advanced turboprops [NASA-CR-174926] p 126 N88-12352
- Applications of the hybrid automated reliability predictor [NASA-TP-2760] p 121 N88-12928

PERFORMANCE TESTS

- An update on the dual-stage test procedure for low-cost measurement of parachute performance p 83 A88-13408
- Study of aeropropulsion laboratory pressure drop rig and recommended test procedure [AD-A184333] p 117 N88-12038
- The aerodynamics of supersonic parachutes [DE87-014846] p 81 N88-12464
- Performance and combustion characteristics of direct-injection stratified-charge rotary engines [NASA-TM-100134] p 100 N88-12490
- Calculation of the tribological properties of surfaces by semi-empirical methods [AD-A184283] p 118 N88-12791

PERSONNEL MANAGEMENT

- Project management issues and lessons learned from computer aided design applications [AIAA PAPER 87-2912] p 120 A88-14267

PERTURBATION

- Numerical study of the entrance flow and its transition in a circular pipe (2) p 117 N88-12011

PHASED ARRAYS

- A conformal aircraft phased array antenna for airplane-satellite communication in the L band [ESA-TT-1057] p 117 N88-11926

PHOTOELASTIC ANALYSIS

- Three-dimensional photoelastic analysis of aeroengine rotary parts p 114 A88-15145

PILOT PERFORMANCE

- An aerodynamic performance evaluation of the NASA/Ames Research Center advanced concepts flight simulator [NASA-TM-89659] p 107 N88-11685
- Effect of motion cues during complex curved approach and landing tasks: A piloted simulation study [NASA-TP-2773] p 96 N88-12480
- Some data processing requirements for precision Nap-Of-the-Earth (NOE) guidance and control of rotorcraft [NASA-CR-177453] p 104 N88-12493
- CGI delay compensation [NASA-TM-86703] p 121 N88-12932

PILOT TRAINING

- Dealing with the problem of delayed ejections p 83 A88-13403

PIPE FLOW

- Dynamics of reverse flows at pump inlet p 118 N88-12636

PIPES (TUBES)

- Numerical study of the entrance flow and its transition in a circular pipe (2) p 117 N88-12011
- Dynamics of reverse flows at pump inlet p 118 N88-12636

PITCH (INCLINATION)

- The effect of pitch location on dynamic stall p 74 A88-14163
- Measurement of velocity and vorticity fields in the wake of an airfoil in periodic pitching motion [NASA-TP-2780] p 127 N88-13002

PITCHING MOMENTS

- An experimental evaluation of advanced rotorcraft airfoils in the NASA Ames eleven-foot transonic wind tunnel [NASA-CR-166587] p 79 N88-11640

PITOT TUBES

- Computation of the compensation pitot tube in front of the nose inlet of an aircraft at transonic speed p 77 A88-16341

PLANFORMS

- Planform effects on the supersonic aerodynamics of multibody configurations [NASA-TP-2762] p 79 N88-12454

PLASTIC AIRCRAFT STRUCTURES

- The history of fibre-reinforced plastics at Fokker - Achievements and lessons learned [IAF PAPER 87-306] p 110 A88-16007

PLUMES

REGIONS

- V/STOL aircraft configurations and opportunities in the Pacific Basin

- [NASA-TM-100005] p 85 N88-11644

REGULATIONS

- Airworthiness of long-life jet transport structures p 95 N88-11674

- Supercomputing of supersonic flows using upwind relaxation and McCormack schemes p 71 A88-14105

RELIABILITY ANALYSIS

- A reliability concept for optimizing aircraft design

- [NASA-TP-2760] p 121 N88-12928

- Applications of the hybrid automated reliability predictor

- [NASA-TP-2760] p 121 N88-12928

REMODELING PILOTED VEHICLES

- RPV carrying airships p 64 A88-14312

REQUIREMENTS

- Rotorcraft Design for Operations

- [AGARD-CP-423] p 94 N88-11649

- The influence of operational requirements on LHX concept formulation p 94 N88-11650

- The EH-101 integrated project: A naval, utility and commercial helicopter system p 95 N88-11672

RESCUE OPERATIONS

- L.W. SKAD (light weight survival kit air droppable) development program p 83 A88-13410

- System for SAR missions p 98 N88-11671

RESEARCH AIRCRAFT

- The value of early flight evaluation of propulsion concepts using the NASA F-15 research airplane

- [AIAA PAPER 87-2877] p 89 A88-14258

- Flight research with the MIT Daedalus prototype
[SAE PAPER 871350] p 91 A88-14373

- The design of a joined wing flight demonstrator aircraft
[AIAA PAPER 87-2930] p 93 A88-16475
- An integrated study of structures, aerodynamics and controls on the forward swept wing X-29A and the oblique wing research aircraft
[NASA-CR-181548] p 96 N88-12486
- RESEARCH AND DEVELOPMENT**
- The development of a standard electronic module with MIL-STD-1750A capabilities
[SAE PAPER 860838] p 114 A88-15578
- Development of maneuver loads spectrum for X-type aircraft
p 102 A88-16342
- RESEARCH FACILITIES**
- MBB simulation facilities applied for rotorcraft research
p 106 N88-11655
- Research simulators for helicopters
p 106 N88-11656
- RESONANCE**
- Analysis of twin supersonic plume resonance
[AIAA PAPER 87-2695] p 123 A88-16550
- RESPONSES**
- Engine/airframe response evaluation of the HH-60A helicopter equipped with the T700-GE-701 transient droop improvement electronic control unit
[AD-A184443] p 103 N88-12492
- RETROFITTING**
- Installation of innovative turbofan engines on current transport airplanes
[AIAA PAPER 87-2921] p 90 A88-14270
- REVERSED FLOW**
- Dynamics of reverse flows at pump inlet
p 118 N88-12636
- REYNOLDS NUMBER**
- Numerical study of the entrance flow and its transition in a circular pipe (2)
p 117 N88-12011
- REYNOLDS STRESS**
- Experimental study of three shock wave/turbulent boundary layer interactions
p 75 A88-14461
- RIBBON PARACHUTES**
- The aerodynamics of supersonic parachutes
[DE87-014846] p 81 N88-12464
- RIGID STRUCTURES**
- The emergence of the rigid airship in the Helitruke
p 66 A88-16658
- Flap-lag equations of motion of rigid, articulated rotor blades with three hinge sequences
[NASA-TM-100023] p 104 N88-12495
- ROBUSTNESS (MATHEMATICS)**
- Future directions in L(infinity) robust control theory
p 121 A88-14945
- Application of robust direct adaptive control to the longitudinal dynamics of a fighter aircraft
p 102 A88-14978
- ROTARY ENGINES**
- Performance and combustion characteristics of direct-injection stratified-charge rotary engines
[NASA-TM-100134] p 100 N88-12490
- ROTARY STABILITY**
- Stabilization of precession-free rotors supported by magnets
p 111 A88-13342
- ROTARY WING AIRCRAFT**
- Civil applications of high-speed rotorcraft and powered-lift aircraft configurations
[NASA-TM-100035] p 85 N88-11643
- Operational load measurements on service helicopters
p 94 N88-11658
- Test stand performance of a convertible engine for advanced V/STOL and rotorcraft propulsion
[NASA-TM-100211] p 100 N88-11679
- ROTARY WINGS**
- Free-wake analysis of helicopter rotors - A boundary element approach
p 68 A88-13265
- A source localization technique for helicopter rotor noise
[AIAA PAPER 87-2743] p 126 A88-16579
- Prediction of blade-vortex interaction noise using measured blade pressures
[AIAA PAPER 87-2749] p 126 A88-16582
- An experimental evaluation of advanced rotorcraft airfoils in the NASA Ames eleven-foot transonic wind tunnel
[NASA-CR-166587] p 79 N88-11640
- Analytic investigation of helicopter rotor blade appended aeroelastic devices
[NASA-CR-166525] p 95 N88-11676
- ROTATING BODIES**
- Semiempirical method for prediction of aerodynamic forces and moments on a steadily spinning light airplane
[NASA-TM-4009] p 80 N88-12456
- ROTATING DISKS**
- Three-dimensional photoelastic analysis of aeroengine rotary parts
p 114 A88-15145
- A nonlinear, asymptotic investigation of the stationary modes of instability of the three-dimensional boundary layer on a rotating disc
p 114 A88-15455

- ROTOR AERODYNAMICS**
- A full potential flow analysis with realistic wake influence for helicopter rotor airload prediction
[NASA-CR-4007] p 67 N88-12452
- ROTOR BLADES**
- Active control of helicopter vibration using multiloop self-adaptive control
p 103 N88-11660
- Minimisation of helicopter vibration through active control of structural response
p 103 N88-11662
- Impacts of rotor hub design criteria on the operational capabilities of rotorcraft systems
p 94 N88-11663
- ROTOR BLADES (TURBOMACHINERY)**
- A method for the efficient calculation of elastic rotor blade dynamic response in forward flight
p 80 N88-12460
- Results of the 1986 NASA/FAA/DFVLR main rotor test entry in the German-Dutch wind tunnel (DNW)

- SHROUDED PROPELLERS**
- A model of the wall boundary layer for ducted propellers
[AIAA PAPER 87-2742] p 126 A88-16578

SILICON CARBIDES

Development of particulate reinforced high strength aluminium alloy for aerospace applications p 109 A88-13198

SIMULATORS

The use of speech technology in air traffic control simulators p 116 A88-16678
A practical helicopter cabin noise simulator p 106 A88-16681

SINGLE STAGE TO ORBIT VEHICLES

Technology challenges for the National Aero-Space Plane [IAF PAPER 87-205] p 92 A88-15938
Hypersonic structures and materials - A progress report p 93 A88-16748

SKIN (STRUCTURAL MEMBER)

Vibration analysis of flat skin-stringer structures by the super matrix method [AIAA PAPER 87-2734] p 116 A88-16573

SKIN FRICTION

27th Lanchester Memorial Lecture - Scale effect in transonic flow p 67 A88-13118

SLENDER WINGS

Experimental research on the structure and 'bursting' of eddies on a slender delta wing - Conducted in a wind tunnel using an acoustooptic measurement method p 69 A88-13429
Vortex dynamics of slender wings as a numerical experiment with discrete-vortex methods p 73 A88-14146

SLIP FLOW

Slip effects on supersonic flowfields around NACA 0012 airfoils p 78 A88-16857

SMOKE

Aircraft passenger protection from smoke and fire p 83 A88-13392

SOFTWARE ENGINEERING

Using microcomputers and specialized software to enhance aircraft design education [AIAA PAPER 87-2866] p 120 A88-14255

SOLAR PROPULSION

The case for a solar powered airship p 91 A88-14317

SOLID LUBRICANTS

Calculation of the tribological properties of surfaces by semi-empirical methods [AD-A184283] p 118 A88-12791

SOLID PROPELLANT IGNITION

Stress corrosion cracking of 4340 steel in aircraft ignition starter residues p 109 A88-15106

SOUND DETECTING AND RANGING

A simple procedure for tracking fast maneuvering aircraft using spatially distributed acoustic sensors p 122 A88-16472

SOUND FIELDS

The active minimization of harmonic enclosed sound fields. I - Theory. II - A computer simulation. III - Experimental verification p 122 A88-13936
Digital control of sound fields in three-dimensional enclosures --- noise level reduction in turboprop aircraft [AIAA PAPER 87-2706] p 93 A88-16558
Active control of sound fields in elastic cylinders by multi-control forces [AIAA PAPER 87-2707] p 124 A88-16559
Excitation of natural oscillations of a boundary layer by an external acoustic field p 118 A88-12634

SOUND PRESSURE

Noise prediction of counter rotation propeller [AIAA PAPER 87-2658] p 122 A88-16527

SOUND TRANSMISSION

Structural influence of the cabin floor on sound transmission into aircraft - Analytical investigations p 92 A88-15725
Light aircraft sound transmission studies - Noise reduction model p 92 A88-16471
Acoustic transmissibility of advanced turboprop aircraft windows [AIAA PAPER 87-2662] p 122 A88-16530
Structure-borne noise transmission in stiffened structures [AIAA PAPER 87-2679] p 123 A88-16540
Mechanisms of active control in cylindrical fuselage structures [AIAA PAPER 87-2703] p 102 A88-16555
Aircraft interior noise reduction by alternate resonance tuning [NASA-CR-181530] p 127 A88-13005

SOUND WAVES

A source localization technique for helicopter rotor noise [AIAA PAPER 87-2743] p 126 A88-16579

SPACE SHUTTLE ORBITERS

Space Shuttle Orbiter ejection seat survey p 108 A88-13390

SPACECRAFT

Safety awareness continuity in transportation and space systems [IAF PAPER 87-568] p 84 A88-16180

SPACECRAFT COMMUNICATION

A conformal aircraft phased array antenna for airplane-satellite communication in the L band [ESA-TT-1057] p 117 A88-11926

SPACECRAFT ENVIRONMENTS

Aircraft fire safety research p 85 A88-12526

SPACECRAFT LAUNCHING

Combined cycle propulsion for hypersonic flight [IAF PAPER 87-263] p 99 A88-15978

SPACECRAFT PROPULSION

Combined cycle propulsion for hypersonic flight [IAF PAPER 87-263] p 99 A88-15978

SPACECRAFT STRUCTURES

Structure-borne noise transmission in stiffened structures [AIAA PAPER 87-2679] p 123 A88-16540
Response of stiffened panels for applications to acoustic fatigue [AIAA PAPER 87-2711] p 116 A88-16560

SPANWISE BLOWING

Aerodynamic effects of distributed spanwise blowing on a fighter configuration p 76 A88-15717

SPECIFICATIONS

The aerodynamics of supersonic parachutes [DE87-014846] p 81 A88-12464

SPECTRAL METHODS

A spectral method for the computation of propeller acoustics [AIAA PAPER 87-2674] p 123 A88-16537

SPEECH RECOGNITION

The use of speech technology in air traffic control simulators p 116 A88-16678

SPEED REGULATORS

Engine/airframe response evaluation of the HH-60A helicopter equipped with the T700-GE-701 transient droop improvement electronic control unit [AD-A184443] p 103 A88-12492

SPIN STABILIZATION

Stabilization of precession-free rotors supported by magnets p 111 A88-13342

STABILITY AUGMENTATION

An analysis of a candidate control algorithm for a ride quality augmentation system [AIAA PAPER 87-2936] p 101 A88-14277

STABILITY DERIVATIVES

Controlling the dynamic environment during NOE flight p 103 A88-11661

STAGNATION POINT

An improved stagnation point viscous shock layer flow over a blunt body p 78 A88-16861

STANDARDIZATION

Study of aeropropulsion laboratory pressure drop rig and recommended test procedure [AD-A184333] p 117 A88-12038

STATIC PRESSURE

Fuselage self-propulsion by static-pressure thrust - Wind-tunnel verification [AIAA PAPER 87-2935] p 90 A88-14276

STEADY FLOW

Response of a delta wing in steady and unsteady flow p 72 A88-14144
Steady and unsteady aerodynamic interference in closely coupled canard/wing configurations p 73 A88-14147
On steady supersonic flow over two-dimensional airfoils p 74 A88-14250
Numerical modeling of stationary separated flows p 114 A88-15186

STEELS

Stress corrosion cracking of 4340 steel in aircraft ignition starter residues p 109 A88-15106

STEERING

GPS vertical axis performance enhancement for helicopter precision landing approach [NASA-CR-177443] p 86 A88-12477

STOCHASTIC PROCESSES

Overlooked potential of systems with Markovian coefficients --- for tracking of maneuvering aircraft p 86 A88-15051

Stochastic modal interaction in linear and nonlinear aeroelastic structures p 116 A88-16435

STRAPDOWN INERTIAL GUIDANCE

NAVSIM 2: A computer program for simulating aided-inertial navigation for aircraft [NASA-CR-177438] p 87 A88-12478

STRESS ANALYSIS

Response of stiffened panels for applications to acoustic fatigue [AIAA PAPER 87-2711] p 116 A88-16560
Failure analysis of composite structure materials [AD-A184468] p 110 A88-12548

STRESS CORROSION CRACKING

Stress corrosion cracking of 4340 steel in aircraft ignition starter residues p 109 A88-15106

STRINGERS

Free vibration characteristics of damped sandwich panel stiffened with damped stringers p 112 A88-13965
Vibration analysis of flat skin-stringer structures by the super matrix method [AIAA PAPER 87-2734] p 116 A88-16573

STROUHAL NUMBER

An experimental investigation of the coherent structure in an incompressible jet [AIAA PAPER 87-2715] p 124 A88-16563

STRUCTURAL ANALYSIS

Integrating nonlinear aerodynamic and structural analysis for a complete fighter configuration [AIAA PAPER 87-2863] p 88 A88-14252
Applications of damage tolerance analysis to in-service aircraft structures p 86 A88-15115
Reduced complexity structural modeling for automated airframe synthesis [NASA-CR-177440] p 67 A88-12453
An integrated study of structures, aerodynamics and controls on the forward swept wing X-29A and the oblique wing research aircraft [NASA-CR-181548] p 96 A88-12486

STRUCTURAL DESIGN

The CREST seat structure development p 87 A88-13383
The Shock and Vibration Digest, Volume 19, No. 11 p 95 A88-11673
Airworthiness of long-life jet transport structures p 95 A88-11674
Parachute materials [DE87-014845] p 110 A88-12550

STRUCTURAL DESIGN CRITERIA

Shape optimization utilizing a boundary element formulation p 111 A88-13281
Structural mechanics of flight vehicles --- Russian book p 115 A88-15647

STRUCTURAL INFLUENCE COEFFICIENTS

Structural influence of the cabin floor on sound transmission into aircraft - Analytical investigations p 92 A88-15725

STRUCTURAL RELIABILITY

A reliability concept for optimizing aircraft design p 97 A88-12622

STRUCTURAL VIBRATION

Free vibration characteristics of damped sandwich panel stiffened with damped stringers p 112 A88-13965
Structural influence of the cabin floor on sound transmission into aircraft - Analytical investigations p 92 A88-15725
Active control of helicopter vibration using multiloop self-adaptive control p 103 A88-11660
Controlling the dynamic environment during NOE flight p 103 A88-11661
Minimisation of helicopter vibration through active control of structural response p 103 A88-11662

SUBSONIC AIRCRAFT

Aeronautical developments for the 21st century [AIAA PAPER 87-3052] p 65 A88-14878

SUBSONIC FLOW

Force and pressure distribution measurements on supported, 65 deg delta wings for subsonic and transonic Mach numbers p 68 A88-13434
Calculation of nonlinear aerodynamic characteristics of interfering airfoils using an eddy cascade method under subsonic flow conditions p 70 A88-13436
Computation of subsonic base flow on a vector processor p 72 A88-14109
Aeroacoustics of subsonic turbulent shear flows [AIAA PAPER 87-2731] p 125 A88-16571
Three-dimensional calculation in high subsonic axial compressor rotor and its comparison with L2F velocity measurement p 117 A88-11886
Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 A88-12469

SUBSONIC SPEED

Aerodynamic sensitivities from subsonic, sonic and supersonic unsteady, nonplanar lifting-surface theory [NASA-TM-100502] p 80 A88-12459

SUBSONIC WIND TUNNELS

Experience with NASA-Langley technology for a free-flying model in a wind tunnel p 100 A88-13430
The vertical test section (VMK) of DFVLR in Cologne-Forz, Federal Republic of Germany (status 1986) [ESA-TT-1053] p 107 A88-11682

SUCTION

The effects of suction at sidewall around the model in a transonic airfoil wind tunnel p 105 A88-16332

SUPERCOMPUTERS

Supercomputing of supersonic flows using upwind relaxation and MacCormack schemes p 71 A88-14105

SUPERCritical AIRFOILS

The effects of suction at sidewall around the model in a transonic airfoil wind tunnel p 105 A88-16332

SUPERCritical WINGS

Investigations on a transonic airfoil with a 30 mm wide perforation/cavity arrangement [ESA-TT-1072] p 79 N88-11634

SUPERSONIC AIRCRAFT

A method to optimize nacelle shape in a supersonic cruise aircraft [AIAA PAPER 87-2865] p 89 A88-14254
Aeronautical developments for the 21st century [AIAA PAPER 87-3052] p 65 A88-14878
Jumping jet power for the next century p 98 A88-15380

SUPERSONIC BOUNDARY LAYERS

An experimental study of the stability of a supersonic boundary layer on a cone p 71 A88-13759
Organized structures in a compressible, turbulent boundary layer p 75 A88-14458

SUPERSONIC COMBUSTION RAMJET ENGINES

Design of three-dimensional scramjet inlets for hypersonic propulsion p 76 A88-15501
Hydrogen scramjet with side wall injection p 99 A88-15527

SUPERSONIC COMPRESSORS

A design of the cascade for a shock-in-rotor supersonic axial-flow compressor p 70 A88-13546

SUPERSONIC FLOW

An assessment of the use of low-order panel methods for the calculation of supersonic flows p 67 A88-13119

Modeling of large-scale vortex structures in supersonic turbulent flow past blunt bodies p 71 A88-13761
Zero-lift drag predictions in supersonic flow for complex configurations p 71 A88-14021
Supercomputing of supersonic flows using upwind relaxation and MacCormack schemes p 71 A88-14105

Performance of a three-dimensional Navier-Stokes code on CYBER 205 for high-speed junction flows p 72 A88-14108

Calculation of wall and free turbulent-shear flows at supersonic speeds p 72 A88-14134
The calibration and operation of a constant-temperature crossed-wire probe in supersonic flow p 113 A88-14175

Unsteady Newtonian flow over two-dimensional airfoils p 74 A88-14246

On steady supersonic flow over two-dimensional airfoils p 74 A88-14250

Experimental study of three shock wave/turbulent boundary layer interactions p 75 A88-14461
Numerical modeling of stationary separated flows p 114 A88-15186

Structure of supersonic turbulent flow past a sharp fin p 76 A88-15708

Constant pressure panel method for supersonic unsteady airload analysis p 77 A88-15720

Transition on swept leading edges at Mach 3.5 p 77 A88-15722

Numerical studies on rarefied flow over a flat plate at an angle of attack p 78 A88-16852

Slip effects on supersonic flowfields around NACA 0012 airfoils p 78 A88-16857

A supersonic potential gradient method for the calculation of unsteady aerodynamic pressures on harmonically oscillating wings [ESA-TT-930] p 79 N88-11631

A hybrid numerical technique for predicting the aerodynamic and acoustic fields of advanced turboprops [NASA-CR-174926] p 126 N88-12352

Conical wing with maximum lift-to-drag ratio in supersonic gas flow p 82 N88-12633

Numerical study of supersonic flow around blunt bodies with extended needle nose p 82 N88-12635

SUPERSONIC INLETS

Computation of the compensation pitot tube in front of the nose inlet of an aircraft at transonic speed p 77 A88-16341

SUPERSONIC JET FLOW

Design of three-dimensional scramjet inlets for hypersonic propulsion p 76 A88-15501

Nozzle geometry effects on supersonic jet interaction [AIAA PAPER 87-2694] p 123 A88-16548

Analysis of twin supersonic plume resonance [AIAA PAPER 87-2695] p 123 A88-16550

SUPERSONIC NOZZLES

High Mach propulsion system installation and exhaust system design considerations [AIAA PAPER 87-2941] p 98 A88-14279

SUPERSONIC SPEED

Flow around a cone at supersonic speed p 68 A88-13287

Aerodynamic sensitivities from subsonic, sonic and supersonic unsteady, nonplanar lifting-surface theory [NASA-TM-100502] p 80 N88-12459

The aerodynamics of supersonic parachutes [DE87-014846] p 81 N88-12464

SUPERSONIC WIND TUNNELS

The 0.6m x 0.6m trisonic test section (TMK) of DFVLR in Cologne-Porz, Federal Republic of Germany (status 1986) [ESA-TT-1052] p 106 N88-11681

SUPERSONICS

Planform effects on the supersonic aerodynamics of multibody configurations [NASA-TP-2762] p 79 N88-12454

SUPPORT SYSTEMS

Support systems for new lighter-than-air vehicles p 105 A88-14315

SURFACE GEOMETRY

Geometry processing -- extraction of geometric features from already constructed curves or surfaces [AIAA PAPER 87-2898] p 120 A88-14264

A geometry system for aerodynamic design [AIAA PAPER 87-2902] p 120 A88-14265

SURFACES

Aerodynamic sensitivities from subsonic, sonic and supersonic unsteady, nonplanar lifting-surface theory [NASA-TM-100502] p 80 N88-12459

SURVIVAL EQUIPMENT

The development of emergency parachute systems for the Voyager world flight p 83 A88-13385
L.W. SKAD (light weight survival kit air droppable) development program p 83 A88-13410

SWEEP EFFECT

Three-dimensional unsteady flow elicited by finite wings and complex configurations p 81 N88-12468

SWEEP FORWARD WINGS

X-29A flight control system performance during flight test [AIAA PAPER 87-2878] p 101 A88-14259

SWEEP WINGS

A comparison of flutter analyses for a 45 deg swept model [AIAA PAPER 87-2886] p 89 A88-14263

Experimental investigation on longitudinal characteristics of the forward swept wing p 77 A88-16336

Three-dimensional unsteady flow elicited by finite wings and complex configurations p 81 N88-12468

Calculation of three-dimensional stationary turbulent boundary layer on root section of wing ignoring compressibility p 82 N88-12630

SWEEPBACK WINGS

Stability analysis as an aid in the design of laminar profiles p 70 A88-13437

SYNTHESIS

Reduced complexity structural modeling for automated airframe synthesis [NASA-CR-177440] p 67 N88-12453

SYSTEM FAILURES

B-1B avionics system safety overview and approach [SAE PAPER 860854] p 84 A88-15587

SYSTEMS ANALYSIS

An evaluation plan of bus architectures and protocols using the NASA Ames intelligent redundant actuation system [NASA-CR-177458] p 96 N88-12482

Applications of the hybrid automated reliability predictor [NASA-TP-2760] p 121 N88-12928

SYSTEMS ENGINEERING

System design and effectiveness - Improving built-in-test designs [AIAA PAPER 87-2945] p 63 A88-14282

Aerodynamic design characteristic of test cell for high by-pass ratio turbofan engine p 77 A88-16338

Research simulators for helicopters p 106 N88-11656

A129 advanced solutions for meeting today's combat helicopter requirement p 95 N88-11669

The Avionics Flight Evaluation System (AFES) of the DFVLR [ESA-TT-1037] p 98 N88-11677

SYSTEMS MANAGEMENT

Aircraft/stores data bus networks [SAE PAPER 860842] p 115 A88-15581

Utilities systems management - Flying demonstrator [SAE PAPER 860851] p 115 A88-15585

T

TABS (CONTROL SURFACES)

Analytic investigation of helicopter rotor blade appended aeroelastic devices [NASA-CR-166525] p 95 N88-11676

TAIL ASSEMBLIES

Effect of permissible variations of center-of-gravity locations of cargo airplane on its mass p 97 N88-12625

TAIL ROTORS

New aerodynamic design of the fenestron for improved performance p 95 N88-11664

TAIL SURFACES

Effect of permissible variations of center-of-gravity locations of cargo airplane on its mass p 97 N88-12625

TAKEOFF

Optimum take-off run of aircraft on ground airfields p 97 N88-12623

TARGET ACQUISITION

A simple procedure for tracking fast maneuvering aircraft using spatially distributed acoustic sensors p 122 A88-16472

TARGETS

Helicopter fire control: Advantages of an automatic target tracker p 106 N88-11667

TASKS

Some data processing requirements for precision Nap-Of-the-Earth (NOE) guidance and control of rotorcraft [NASA-CR-177453] p 104 N88-12493

TECHNOLOGICAL FORECASTING

Defense suppression technology alternatives for future generation aircraft [AIAA PAPER 87-2925] p 63 A88-14273

The future of flight simulation p 121 A88-16685

TECHNOLOGY ASSESSMENT

Development of aerodynamics research at the Institute of Theoretical and Applied Mechanics of the Siberian Branch of the Academy of Sciences of the USSR p 70 A88-13740

Preliminary flight assessment of the X-29A advanced technology demonstrator [AIAA PAPER 87-2949] p 90 A88-14284

Recent airship designs and today's achievements p 64 A88-14302

A perspective of computational fluid dynamics p 75 A88-15205

Technology challenges for the National Aero-Space Plane [IAF PAPER 87-205] p 92 A88-15938

A critical assessment of wind tunnel results for the NACA 0012 airfoil [NASA-TM-100019] p 79 N88-11636

TECHNOLOGY UTILIZATION

Composite drive shafting applications p 109 A88-13177

Military and civil applications for airships p 64 A88-14308

The future of flight simulation p 121 A88-16685

TEMPERATURE CONTROL

Heat removal key to shrinking avionics p 117 A88-16747

TEMPERATURE DEPENDENCE

The calibration and operation of a constant-temperature crossed-wire probe in supersonic flow p 113 A88-14175

TEMPERATURE GRADIENTS

Crack initiation and propagation due to cyclic thermal gradients -- aircraft turbine blades [ESA-TT-1023] p 118 N88-12114

TENSILE STRESS

The effects of prestress on low cycle fatigue and fatigue crack growth behaviours for alloy GH33A p 110 A88-16331

TEST EQUIPMENT

Aerodynamic design characteristic of test cell for high by-pass ratio turbofan engine p 77 A88-16338

TEST FACILITIES

Measured performance of the heat exchanger in the NASA icing research tunnel under severe icing and dry-air conditions [NASA-TM-100116] p 118 N88-12796

THERMAL CONDUCTIVITY

A heat transfer model for a heated helium airship [AD-A183786] p 78 N88-11629

THERMAL CONDUCTIVITY GAGES

A study of a multi-layered thin film heat transfer gauge and a new method of measuring heat transfer rate with it p 113 A88-14248

THERMAL CONTROL COATINGS

Progress toward life modeling of thermal barrier coatings for aircraft gas turbine engines [ASME PAPER 87-ICE-18] p 110 A88-15120

THERMODYNAMICS

A heat transfer model for a heated helium airship [AD-A183786] p 78 N88-11629

THERMOPLASTIC RESINS

Field repair compounds for thermoset and thermoplastic composites p 108 A88-13148

THERMOSETTING RESINS

Field repair compounds for thermoset and thermoplastic composites p 108 A88-13148

THIN AIRFOILS

Numerical simulation of two-dimensional transonic flow over thin oscillating airfoil p 77 A88-16442

THIN BODIES

Numerical solution of non-stationary three-dimensional transonic flow over a thin body p 77 A88-16446

THIN FILMS

A study of a multi-layered thin film heat transfer gauge and a new method of measuring heat transfer rate with it p 113 A88-14248

THIN WALLED SHELLS

Models for evaluating the performance of propeller aircraft active noise control systems [AIAA PAPER 87-2704] p 93 A88-16556

THIN WINGS

A numerical model for analysis of thin wings in inviscid incompressible flow p 68 A88-13121

Numerical simulation of aerodynamic sound radiation from two-dimensional wing [AIAA PAPER 87-2672] p 123 A88-16536

A supersonic potential gradient method for the calculation of unsteady aerodynamic pressures on harmonically oscillating wings [ESA-TT-930] p 79 A88-11631

THREE DIMENSIONAL BODIES

Aerodynamic analysis of complicated three-dimensional configurations using surface panel methods p 68 A88-13266

A high order panel method for determining incompressible flows around arbitrary bodies p 68 A88-13267

Use of conformal mapping in grid generation for complex three-dimensional configurations p 76 A88-15702

THREE DIMENSIONAL BOUNDARY LAYER

A nonlinear, asymptotic investigation of the stationary modes of instability of the three-dimensional boundary layer on a rotating disc p 114 A88-15455

THREE DIMENSIONAL FLOW

Vectorizable implicit algorithms for the flux-difference split, three-dimensional Navier-Stokes equations p 120 A88-14103

Performance of a three-dimensional Navier-Stokes code on CYBER 205 for high-speed juncture flows p 72 A88-14108

Block-structured solution scheme for analyzing three-dimensional transonic potential flows p 76 A88-15703

Numerical solution of non-stationary three-dimensional transonic flow over a thin body p 77 A88-16446

Three-dimensional calculation in high subsonic axial compressor rotor and its comparison with L2F velocity measurement p 117 A88-11886

On the scheme dependency of the three-dimensional Euler solutions p 117 A88-12010

Development and application of computational aerothermodynamics flowfield computer codes [NASA-CR-181534] p 81 A88-12465

THRUST DISTRIBUTION

Fuselage self-propulsion by static-pressure thrust - Wind-tunnel verification [AIAA PAPER 87-2935] p 90 A88-14276

THRUST MEASUREMENT

In-flight thrust determination and uncertainty [SAE SP-674] p 91 A88-15226

In-flight thrust determination [SAE AIR 1703] p 91 A88-15227

Uncertainty of in-flight thrust determination [SAE AIR 1678] p 92 A88-15228

THRUST VECTOR CONTROL

Challenges of developing controllable propulsion for the Crew Escape Technologies (CREST) seat p 88 A88-13399

Effects of jet exhaust yaw vane installation and operation on the longitudinal and lateral-directional characteristics of the F-14 airplane [NASA-TP-2769] p 80 A88-12455

THRUST-WEIGHT RATIO

Thrust savings limitations with blown high lift wings [AIAA PAPER 87-2884] p 89 A88-14262

THUNDERSTORMS

Experimental and analytic studies of the triggered lightning environment of the F106B [NASA-CR-4104] p 119 A88-12897

TILT ROTOR AIRCRAFT

Inclined planes --- tilt-rotor aircraft configurations p 88 A88-13973

Tilting at new aviation markets --- tilt rotor aircraft p 65 A88-15175

Rotorcraft designs for the year 2000 p 95 A88-11665

TIME

Modeling XV-15 tilt-rotor aircraft dynamics by frequency and time-domain identification techniques p 94 A88-11657

TIME LAG

Flap-lag equations of motion of rigid, articulated rotor blades with three hinge sequences [NASA-TM-100023] p 104 A88-12495

CGI delay compensation [NASA-TM-86703] p 121 A88-12932

TIME MARCHING

Application of Runge Kutta time marching scheme for the computation of transonic flows in turbomachines [NASA-TM-86997] p 81 A88-12461

TIP SPEED

Cruise noise of the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A [AIAA PAPER 87-2717] p 125 A88-16565

TITANIUM ALLOYS

Status of titanium alloys R and D described p 110 A88-11876

TOWING

A demonstration of the use of an airship for towing a reflective sphere at medium altitudes p 64 A88-14313

TOXICITY

Aircraft fire safety research p 85 A88-12526

TRACKING (POSITION)

A decoupling approach to the design of the two-degree-of-freedom tracking control systems --- for fighter aircraft p 102 A88-14961

A simple procedure for tracking fast maneuvering aircraft using spatially distributed acoustic sensors p 122 A88-16472

Helicopter fire control: Advantages of an automatic target tracker p 106 A88-11667

Effect of motion cues during complex curved approach and landing tasks: A piloted simulation study [NASA-TP-2773] p 96 A88-12480

TRACKING FILTERS

Overlooked potential of systems with Markovian coefficients --- for tracking of maneuvering aircraft p 86 A88-15051

High dynamic GPS receiver using maximum likelihood estimation and frequency tracking p 86 A88-15360

TRAFFIC CONTROL

Simulation of an enhanced TCAS 2 system in operation [NASA-CR-181545] p 87 A88-12479

TRAINING AIRCRAFT

Introducing the Mk15 ejection seat p 87 A88-13391

TRAINING SIMULATORS

International Conference on Simulators, 2nd, University of Warwick, Coventry, England, Sept. 7-11, 1986, Proceedings p 105 A88-16676

Cockpit procedure trainers for military aircraft p 106 A88-16683

TRANSITION FLOW

Transition on swept leading edges at Mach 3.5 p 77 A88-15722

Numerical study of the entrance flow and its transition in a circular pipe (2) p 117 A88-12011

TRANSMISSIONS (MACHINE ELEMENTS)

Composite drive shafting applications p 109 A88-13177

The flight evaluation of an advanced engine display and monitoring system p 97 A88-11659

A129 advanced solutions for meeting today's combat helicopter requirement p 95 A88-11669

TRANSONIC FLOW

27th Lanchester Memorial Lecture - Scale effect in transonic flow p 67 A88-13118

Experimental investigation of shock-boundary layer interference with passive influence p 69 A88-13431

Force and pressure distribution measurements on supported, 65 deg delta wings for subsonic and transonic Mach numbers p 69 A88-13434

Addendum to the calculation of transonic potential flow through a two-dimensional cascade p 70 A88-13545

A mixed direct-inverse problem of the transonic cascade p 71 A88-14017

Block-structured solution scheme for analyzing three-dimensional transonic potential flows p 76 A88-15703

Viscous-inviscid analysis of transonic and low Reynolds number airfoils p 76 A88-15710

Prediction of gust loadings and alleviation at transonic speeds p 77 A88-15721

Numerical simulation of two-dimensional transonic flow over thin oscillating airfoil p 77 A88-16442

Numerical solution of non-stationary three-dimensional transonic flow over a thin body p 77 A88-16446

Investigations on a transonic airfoil with a 30 mm wide perforation/cavity arrangement [ESA-TT-1072] p 79 A88-11634

Application of Runge Kutta time marching scheme for the computation of transonic flows in turbomachines [NASA-TM-86997] p 81 A88-12461

Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 A88-12469

Some asymptotic modes of transonic vortex flow p 82 A88-12632

TRANSONIC SPEED

Transonic aeroelasticity of wings with tip stores p 92 A88-15719

An experimental evaluation of advanced rotorcraft airfoils in the NASA Ames eleven-foot transonic wind tunnel [NASA-CR-166587] p 79 A88-11640

TRANSONIC WIND TUNNELS

The effects of suction at sidewall around the model in a transonic airfoil wind tunnel p 105 A88-16332

Aeroacoustic effects of body blockage in cavity flow [AIAA PAPER 87-2667] p 123 A88-16533

The 0.6m x 0.6m trisonic test section (TMK) of DFVLR in Cologne-Forz, Federal Republic of Germany (status 1986) [ESA-TT-1052] p 106 A88-11681

TRANSPORT AIRCRAFT

Airships face a military future p 63 A88-14050

Installation of innovative turbofan engines on current transport airplanes [AIAA PAPER 87-2921] p 90 A88-14270

Design and validation of fault-tolerant flight systems [AIAA PAPER 87-2923] p 120 A88-14271

Compromise - An effective approach for conceptual aircraft design [AIAA PAPER 87-2965] p 90 A88-14287

Transport aircraft safety - An aviation community commitment [SAE PAPER 871328] p 128 A88-14360

Aircraft maintenance and production technology: Symposium, Technische Hogeschool Delft, Netherlands, Apr. 25, 1986, Proceedings p 65 A88-14879

Tilting at new aviation markets --- tilt rotor aircraft p 65 A88-15175

Fire and foams in transport applications - Aircraft p 110 A88-16745

An aerodynamic performance evaluation of the NASA/Ames Research Center advanced concepts flight simulator [NASA-TM-89659] p 107 A88-11685

Effect of permissible variations of center-of-gravity locations of cargo airplane on its mass p 97 A88-12625

TRIANGLES

Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 A88-12469

TRIBOLOGY

Calculation of the tribological properties of surfaces by semi-empirical methods [AD-A184283] p 118 A88-12791

TRISONIC WIND TUNNELS

The 0.6m x 0.6m trisonic test section (TMK) of DFVLR in Cologne-Forz, Federal Republic of Germany (status 1986) [ESA-TT-1052] p 106 A88-11681

TURBINE BLADES

Crack initiation and propagation due to cyclic thermal gradients --- aircraft turbine blades [ESA-TT-1023] p 118 A88-12114

TURBOCOMPRESSORS

A design of the cascade for a shock-in-rotor supersonic axial-flow compressor p 70 A88-13546

Three-dimensional calculation in high subsonic axial compressor rotor and its comparison with L2F velocity measurement p 117 A88-11886

TURBOFAN ENGINES

Installation of innovative turbofan engines on current transport airplanes [AIAA PAPER 87-2921] p 90 A88-14270

Aerodynamic design characteristic of test cell for high by-pass ratio turbofan engine p 77 A88-16338

A reflection mechanism for aft fan tone noise from turbofan engines [AIAA PAPER 87-2699] p 124 A88-16551

A study of some factors affecting the aeroacoustic performance of a ducted contra-rotating axial flow fan stage [AIAA PAPER 87-2730] p 125 A88-16570

Test stand performance of a convertible engine for advanced V/STOL and rotorcraft propulsion [NASA-TM-100211] p 100 A88-11679

TURBOJET ENGINES

Application of a fuzzy controller in fuel system of turbojet engine p 100 A88-16902

TURBOMACHINERY

Application of Runge Kutta time marching scheme for the computation of transonic flows in turbomachines [NASA-TM-86997] p 81 A88-12461

TURBOPROP AIRCRAFT

- Introducing the Mk15 ejection seat p 87 A88-13391
Acoustic transmissibility of advanced turboprop aircraft windows
[AIAA PAPER 87-2662] p 122 A88-16530
Digital control of sound fields in three-dimensional enclosures --- noise level reduction in turboprop aircraft
[AIAA PAPER 87-2706] p 93 A88-16558
Measurements of propeller noise in a light turboprop airplane
[AIAA PAPER 87-2737] p 93 A88-16575
A hybrid numerical technique for predicting the aerodynamic and acoustic fields of advanced turboprops
[NASA-CR-174926] p 126 N88-12352

TURBOSHAPTS

- TM 333 and TM 319 turboshafts - Two new powerplants for helicopters p 99 A88-16729
The RTM 322 turboshaft engine p 99 A88-16731
RTM322 electronic control and anticipated developments p 99 A88-16732
TM 319 and TM 333 electronic control design and operational features p 99 A88-16733
Test stand performance of a convertible engine for advanced V/STOL and rotorcraft propulsion
[NASA-TM-100211] p 100 N88-11679

TURBULENT BOUNDARY LAYER

- Organized structures in a compressible, turbulent boundary layer p 75 A88-14458
Experimental study of three shock wave/turbulent boundary layer interactions p 75 A88-14461
Numerical simulation of aerodynamic sound radiation from two-dimensional wing
[AIAA PAPER 87-2672] p 123 A88-16536
Calculation of three-dimensional stationary turbulent boundary layer on root section of wing ignoring compressibility p 82 N88-12630

TURBULENT FLOW

- Modeling of large-scale vortex structures in supersonic turbulent flow past blunt bodies p 71 A88-13761
Calculation of wall and free turbulent-shear flows at supersonic speeds p 72 A88-14134
Structure of supersonic turbulent flow past a sharp fin
Aeroacoustics of subsonic turbulent shear flows
[AIAA PAPER 87-2731] p 125 A88-16571
Numerical study of the entrance flow and its transition in a circular pipe (2) p 117 N88-12011

TURBULENT JETS

- Computations of a turbulent jet-edge flow field p 72 A88-14126
Pressure field generated by jet-on-jet impingement p 115 A88-15706

TWO DIMENSIONAL BODIES

- Unsteady Newtonian flow over two-dimensional airfoils p 74 A88-14246
On steady supersonic flow over two-dimensional airfoils p 74 A88-14250
A critical assessment of wind tunnel results for the NACA 0012 airfoil
[NASA-TM-100019] p 79 N88-11636

TWO DIMENSIONAL FLOW

- Interactions of a two-dimensional vortex with a wall layer of vorticity p 72 A88-14128
Numerical simulation of two-dimensional transonic flow over thin oscillating airfoil p 77 A88-16442
Numerical simulation of aerodynamic sound radiation from two-dimensional wing
[AIAA PAPER 87-2672] p 123 A88-16536
Solution of the two-dimensional Euler equations on unstructured triangular meshes p 81 N88-12469

TWO PHASE FLOW

- A study of two-phase flow in a reduced gravity environment
[NASA-CR-172035] p 118 N88-12617

U

UH-60A HELICOPTER

- Analytic investigation of helicopter rotor blade appended aerodynamic devices
[NASA-CR-166525] p 95 N88-11676

ULTRAHIGH FREQUENCIES

- Advanced MIL-STD-1553 UHF/VHF radio
[SAE PAPER 860840] p 114 A88-15579
A conformal aircraft phased array antenna for airplane-satellite communication in the L band
[ESA-TT-1057] p 117 N88-11926

ULTRALIGHT AIRCRAFT

- Flight research with the MIT Daedalus prototype
[SAE PAPER 871350] p 91 A88-14373

UNIFORM FLOW

- A spectral method for the computation of propeller acoustics
[AIAA PAPER 87-2674] p 123 A88-16537

UNSTEADY FLOW

- A boundary element method for unsteady viscous flows p 68 A88-13270
Forum on Unsteady Flow Separation, Cincinnati, OH, June 14-17, 1987, Proceedings p 112 A88-14141
Response of a delta wing in steady and unsteady flow p 72 A88-14144
Steady and unsteady aerodynamic interference in closely coupled canard/wing configurations p 73 A88-14147
Break-up in unsteady separation p 112 A88-14149
Unsteady separation at low Reynolds numbers p 73 A88-14150
Analysis of unsteady wake of a circular cylinder using Navier-Stokes equations p 73 A88-14160
On the unsteady flow past an impulsively started airfoil at a high angle of attack p 74 A88-14162
Flow development on a Joukowski airfoil started impulsively from rest p 74 A88-14164
Unsteady Newtonian flow over two-dimensional airfoils p 74 A88-14246
Constant pressure panel method for supersonic unsteady airload analysis p 77 A88-15720
Numerical simulation of two-dimensional transonic flow over thin oscillating airfoil p 77 A88-16442
On the prediction of the aeroelastic behavior of lifting systems due to flow separation
[ESA-TT-1043] p 79 N88-11633
Aerodynamic sensitivities from subsonic, sonic and supersonic unsteady, nonplanar lifting-surface theory
[NASA-TM-100502] p 80 N88-12459
Application of Runge Kutta time marching scheme for the computation of transonic flows in turbomachines
[NASA-TM-86997] p 81 N88-12461
Three-dimensional unsteady flow elicited by finite wings and complex configurations p 81 N88-12468

UNSTEADY STATE

- An unsteady lifting-line theory p 71 A88-13957

UPPER ATMOSPHERE

- Upper atmosphere aerodynamics - Mathematical modelling and experiment validation p 78 A88-16863

USER MANUALS (COMPUTER PROGRAMS)

- Digital-flight-control-system software written in automated-engineering-design language: A user's guide of verification and validation tools
[NASA-TM-88313] p 104 N88-12494

UTILITY AIRCRAFT

- Aerial logging --- by airships cranes p 66 A88-16655
An overview of Ulita Industries Inc. p 66 A88-16662

V

V/STOL AIRCRAFT

- Modification of VTOL flight for reduction of hot gas ingestion and foreign object damage
[AIAA PAPER 87-2883] p 83 A88-14261
Civil applications of high-speed rotorcraft and powered-lift aircraft configurations
[NASA-TM-100035] p 85 N88-11643
V/STOL aircraft configurations and opportunities in the Pacific Basin
[NASA-TM-100005] p 85 N88-11644
Test stand performance of a convertible engine for advanced V/STOL and rotorcraft propulsion
[NASA-TM-100211] p 100 N88-11679
Flight propulsion control integration for V/STOL aircraft
[NASA-TM-100226] p 103 N88-11680

VARIABLE GEOMETRY STRUCTURES

- Analysis of the performance of aerodynamically variable nozzle p 77 A88-16339
Test stand performance of a convertible engine for advanced V/STOL and rotorcraft propulsion
[NASA-TM-100211] p 100 N88-11679

VARIABLE SWEEP WINGS

- The influence of unsteady aerodynamic forces on dynamic response of a variable sweep aircraft p 101 A88-14018

VARIATIONAL PRINCIPLES

- On the scheme dependency of the three-dimensional Euler solutions p 117 N88-12010

VECTOR ANALYSIS

- Computation of subsonic base flow on a vector processor p 72 A88-14109

VELOCITY MEASUREMENT

- Three-dimensional calculation in high subsonic axial compressor rotor and its comparison with L2F velocity measurement p 117 N88-11886

VERTICAL LANDING

- Modification of VTOL flight for reduction of hot gas ingestion and foreign object damage
[AIAA PAPER 87-2883] p 83 A88-14261
Jumping jet power for the next century p 98 A88-15380

- GPS vertical axis performance enhancement for helicopter precision landing approach
[NASA-CR-177443] p 86 N88-12477

VERTICAL ORIENTATION

- Investigation of vertical axis handling qualities for helicopter hover and NOE flight p 103 N88-11653
Effects of combining vertical and horizontal information into a primary flight display
[NASA-TP-2783] p 98 N88-12487

VERTICAL TAKEOFF

- Modification of VTOL flight for reduction of hot gas ingestion and foreign object damage
[AIAA PAPER 87-2883] p 83 A88-14261
The ability of modified pavement quality concrete to resist ground erosion caused by VTOL aircraft
[BAE-ARG-238] p 107 N88-11683

VERY HIGH FREQUENCIES

- Advanced MIL-STD-1553 UHF/VHF radio
[SAE PAPER 860840] p 114 A88-15579

VHSIC (CIRCUITS)

- The development of a standard electronic module with MIL-STD-1750A capabilities
[SAE PAPER 860838] p 114 A88-15578

VIBRATION

- An advanced system for processing dynamic test data
[AIAA PAPER 87-2687] p 105 A88-16543
The Shock and Vibration Digest, Volume 19, No. 11 p 95 N88-11673

VIBRATION DAMPING

- Free vibration characteristics of damped sandwich panel stiffened with damped stringers p 112 A88-13965

VIBRATION ISOLATORS

- Controlling the dynamic environment during NOE flight p 103 N88-11661

VIBRATION MEASUREMENT

- On the prediction of the aeroelastic behavior of lifting systems due to flow separation
[ESA-TT-1043] p 79 N88-11633

VIBRATORY LOADS

- Analytic investigation of helicopter rotor blade appended aerodynamic devices
[NASA-CR-166525] p 95 N88-11676

VISCOS FLOW

- A boundary element method for unsteady viscous flows p 68 A88-13270
The theoretical model and numerical solution for the compressible viscous vortex cores p 71 A88-14016
The calculation of aerofoil friction drag in compressibility viscous flow p 71 A88-14023
Numerical modeling of stationary separated flows p 114 A88-15186
Impulse wind tunnels --- Russian book p 76 A88-15676
Viscous-inviscid analysis of transonic and low Reynolds number airfoils p 76 A88-15710
An improved stagnation point viscous shock layer flow over a blunt body p 78 A88-16861

VISIBILITY

- Handling qualities criterion for very low visibility rotorcraft p 103 N88-11654

VISUAL CONTROL

- Flight simulator visual systems p 105 A88-16680

VORTEX GENERATORS

- Eddy generation in heat conductors p 112 A88-13427

VORTEX SHEETS

- A numerical model for analysis of thin wings in inviscid incompressible flow p 68 A88-13121

VORTICES

- Experimental research on the structure and 'bursting' of eddies on a slender delta wing - Conducted in a wind tunnel using an acoustooptic measurement method p 69 A88-13429
Calculation of nonlinear aerodynamic characteristics of interfering airfoils using an eddy cascade method under subsonic flow conditions p 70 A88-13436
Modeling of large-scale vortex structures in supersonic turbulent flow past blunt bodies p 71 A88-13761
The theoretical model and numerical solution for the compressible viscous vortex cores p 71 A88-14016
An investigation of the structure of a ground-trailing vortex p 112 A88-14019
Interactions of a two-dimensional vortex with a wall layer of vorticity p 72 A88-14128
Vortex dynamics of slender wings as a numerical experiment with discrete-vortex methods p 73 A88-14146
Structure-borne noise control for propeller aircraft
[AIAA PAPER 87-2680] p 123 A88-16541
Some asymptotic modes of transonic vortex flow p 82 N88-12632
Measurement of velocity and vorticity fields in the wake of an airfoil in periodic pitching motion
[NASA-TP-2780] p 127 N88-13002

VORTICITY

- The Goertler instability on an airfoil
[AIAA PAPER 85-0491] p 75 A88-14848
- Measurement of velocity and vorticity fields in the wake of an airfoil in periodic pitching motion
[NASA-TP-2780] p 127 N88-13002

W**WAKES**

- Analysis of unsteady wake of a circular cylinder using Navier-Stokes equations p 73 A88-14160
- Investigations on a transonic airfoil with a 30 mm wide perforation/cavity arrangement
[ESA-TT-1072] p 79 N88-11634
- A full potential flow analysis with realistic wake influence for helicopter rotor airload prediction
[NASA-CR-4007] p 67 N88-12452
- Measurement of velocity and vorticity fields in the wake of an airfoil in periodic pitching motion
[NASA-TP-2780] p 127 N88-13002

WALL FLOW

- Interactions of a two-dimensional vortex with a wall layer of vorticity p 72 A88-14128
- Calculation of wall and free turbulent-shear flows at supersonic speeds p 72 A88-14134
- Aeroacoustic effects of body blockage in cavity flow
[AIAA PAPER 87-2667] p 123 A88-16533
- A model of the wall boundary layer for ducted propellers
[AIAA PAPER 87-2742] p 126 A88-16578

WALLS

- Aircraft interior noise reduction by alternate resonance tuning
[NASA-CR-181530] p 127 N88-13005

WANKEL ENGINES

- Performance and combustion characteristics of direct-injection stratified-charge rotary engines
[NASA-TM-100134] p 100 N88-12490

WARNING SYSTEMS

- The flight evaluation of an advanced engine display and monitoring system p 97 N88-11659

WATER FLOW

- Experimental evidence for modifying the current physical model for ice accretion on aircraft surfaces
[NASA-TM-87184] p 85 N88-12473

WATER LANDING

- H-46 helicopter emergency flotation system (HEFS)
p 83 A88-13397

WAVE DIFFRACTION

- Diffraction of an oblique shock wave in the vicinity of an external right-angle corner p 70 A88-13741

WAVE REFLECTION

- A reflection mechanism for aft fan tone noise from turbofan engines
[AIAA PAPER 87-2699] p 124 A88-16551

WAVEFORMS

- Experimental and analytic studies of the triggered lightning environment of the F106B
[NASA-CR-4104] p 119 N88-12897

WEAPON SYSTEMS

- The B. Ae. Hawk - A first decade of development
[AIAA PAPER 87-2911] p 89 A88-14266
- Integration of manned simulation and flight test in an operational test and evaluation program
[AIAA PAPER 87-2924] p 105 A88-14272
- Aircraft/stores data bus networks
[SAE PAPER 860842] p 115 A88-15581
- B-1B avionics system safety overview and approach
[SAE PAPER 860854] p 84 A88-15587

WIND EFFECTS

- The CREST windblast protection system design
p 87 A88-13384

WIND SHEAR

- Wind shear tunnel with inclined wire gauze
p 105 A88-14000

WIND TUNNEL APPARATUS

- Wind shear tunnel with inclined wire gauze
p 105 A88-14000
- A study of a multi-layered thin film heat transfer gauge and a new method of measuring heat transfer rate with it
p 113 A88-14248
- Flow-induced noise from wind tunnel turbulence reduction screens
[AIAA PAPER 87-2728] p 125 A88-16569

WIND TUNNEL DRIVES

- Analysis of 7- X 10-foot high speed wind tunnel shaft loads in support of fan blade failure investigation
[NASA-TM-100504] p 107 N88-12496

WIND TUNNEL MODELS

- Experience with NASA-Langley technology for a free-flying model in a wind tunnel p 100 A88-13430
- A comparison of flutter analyses for a 45 deg swept model
[AIAA PAPER 87-2886] p 89 A88-14263

Impulse wind tunnels --- Russian book

p 76 A88-15676

WIND TUNNEL STABILITY TESTS

- Effects of jet exhaust yaw vane installation and operation on the longitudinal and lateral-directional characteristics of the F-14 airplane
[NASA-TP-2769] p 80 N88-12455

WIND TUNNEL TESTS

- Experimental research on the structure and 'bursting' of eddies on a slender delta wing - Conducted in a wind tunnel using an acoustooptic measurement method
p 69 A88-13429
- Experience with NASA-Langley technology for a free-flying model in a wind tunnel p 100 A88-13430
- Experimental investigations on double delta wings under asymmetric flow conditions p 69 A88-13432
- Flow field study on a 65 deg delta wing
p 69 A88-13435

- Development of aerodynamics research at the Institute of Theoretical and Applied Mechanics of the Siberian Branch of the Academy of Sciences of the USSR
p 70 A88-13740
- An experimental study of the stability of a supersonic boundary layer on a cone p 71 A88-13759
- An investigation of the structure of a ground-trailing vortex p 112 A88-14019

- Features of transitional separation bubbles in an oscillating freestream p 73 A88-14161
- Exploiting the close-coupled canard
[AIAA PAPER 87-2864] p 88 A88-14253
- Fuselage self-propulsion by static-pressure thrust - Wind-tunnel verification
[AIAA PAPER 87-2935] p 90 A88-14276

- Effect of acoustic excitation on the flow over a low-Re airfoil p 75 A88-14459
- The Goertler instability on an airfoil
[AIAA PAPER 85-0491] p 75 A88-14848
- Hydrogen scramjet with side wall injection
p 99 A88-15527

- Aerodynamic effects of distributed spanwise blowing on a fighter configuration p 76 A88-15717
- Lift-curve characteristics for an airfoil pitching at constant rate p 76 A88-15718
- Transition on swept leading edges at Mach 3.5
p 77 A88-15722
- The effects of suction at sidewall around the model in a transonic airfoil wind tunnel p 105 A88-16332

- Experimental investigation on longitudinal characteristics of the forward swept wing
p 77 A88-16336
- The design of a joined wing flight demonstrator aircraft
[AIAA PAPER 87-2930] p 93 A88-16475

- Noise characteristics of model counter-rotating Prop-Fans
[AIAA PAPER 87-2656] p 122 A88-16526
- Cruise noise of the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[AIAA PAPER 87-2717] p 125 A88-16565

- The prediction of helicopter tail rotor noise on the flight path
[AIAA PAPER 87-2747] p 126 A88-16581
- A critical assessment of wind tunnel results for the NACA 0012 airfoil
[NASA-TM-100019] p 79 N88-11636

- An experimental evaluation of advanced rotorcraft airfoils in the NASA Ames eleven-foot transonic wind tunnel
[NASA-CR-166587] p 79 N88-11640
- Experimental aerothermodynamic research of hypersonic aircraft
[NASA-CR-181533] p 96 N88-12483

- Results of the 1986 NASA/FAA/DFVLR main rotor test entry in the German-Dutch wind tunnel (DNW)
[NASA-TM-100507] p 127 N88-13003

WIND TUNNELS

- Aeronautical developments for the 21st century
[AIAA PAPER 87-3052] p 65 A88-14878
- Theoretical and experimental study of flow-control devices for inlets of indraft wind tunnels
p 107 N88-11684

- Analysis of 7- X 10-foot high speed wind tunnel shaft loads in support of fan blade failure investigation
[NASA-TM-100504] p 107 N88-12496
- Measured performance of the heat exchanger in the NASA icing research tunnel under severe icing and dry-air conditions
[NASA-TM-100116] p 118 N88-12796

WINDOWS (APERTURES)

- Acoustic transmissibility of advanced turboprop aircraft windows
[AIAA PAPER 87-2662] p 122 A88-16530

WIND FLOW METHOD TESTS

- A numerical model for analysis of thin wings in inviscid incompressible flow p 68 A88-13121

- Response of a delta wing in steady and unsteady flow
p 72 A88-14144

WING LOADING

- Thrust savings limitations with blown high lift wings
[AIAA PAPER 87-2884] p 89 A88-14262
- Transonic aeroelasticity of wings with tip stores
p 92 A88-15719

WING OSCILLATIONS

- An unsteady lifting-line theory p 71 A88-13957
- Hydrodynamic characteristics of a rigid rectangular oscillating wing p 75 A88-14678
- Numerical simulation of two-dimensional transonic flow over thin oscillating airfoil p 77 A88-16442

WING PLANFORMS

- An experimental investigation of wing/fuselage integration geometries
[AIAA PAPER 87-2937] p 74 A88-14278

WING PROFILES

- A boundary element method for unsteady viscous flows p 68 A88-13270
- Three-dimensional unsteady flow elicited by finite wings and complex configurations p 81 N88-12468
- Conical wing with maximum lift-to-drag ratio in supersonic gas flow p 82 N88-12633

WING ROOTS

- An experimental investigation of wing/fuselage integration geometries
[AIAA PAPER 87-2937] p 74 A88-14278

WING TIPS

- A numerical model for analysis of thin wings in inviscid incompressible flow p 68 A88-13121
- Transonic aeroelasticity of wings with tip stores
p 92 A88-15719

- Analytic investigation of helicopter rotor blade appended aeroelastic devices
[NASA-CR-166525] p 95 N88-11676

WINGS

- Structure-borne noise control for propeller aircraft
[AIAA PAPER 87-2680] p 123 A88-16541
- On the prediction of the aeroelastic behavior of lifting systems due to flow separation
[ESA-TT-1043] p 79 N88-11633
- On the scheme dependency of the three-dimensional Euler solutions p 117 N88-12010
- Reduced complexity structural modeling for automated airframe synthesis
[NASA-CR-177440] p 67 N88-12453
- Calculation of aerodynamic characteristics of three-dimensional finite span wings in potential incompressible flow p 82 N88-12631

WORKLOADS (PSYCHOPHYSIOLOGY)

- Effect of motion cues during complex curved approach and landing tasks: A piloted simulation study
[NASA-TP-2773] p 96 N88-12480

X**X WING ROTORS**

- Rotorcraft designs for the year 2000
p 95 N88-11665

X-29 AIRCRAFT

- Steady and unsteady aerodynamic interference in closely coupled canard/wing configurations
p 73 A88-14147

- X-29A flight control system performance during flight test
[AIAA PAPER 87-2878] p 101 A88-14259

- Preliminary flight assessment of the X-29A advanced technology demonstrator
[AIAA PAPER 87-2949] p 90 A88-14284

- Flight control of an X-29 type aircraft via a combination of LQ optimization techniques p 101 A88-14960
- An integrated study of structures, aerodynamics and controls on the forward swept wing X-29A and the oblique wing research aircraft
[NASA-CR-181548] p 96 N88-12486

X-3 AIRCRAFT

- X-31A --- West German/USA experimental aircraft
[SAE PAPER 871346] p 91 A88-14370

XV-15 AIRCRAFT

- Tilting at new aviation markets --- tilt rotor aircraft
p 65 A88-15175

- Modeling XV-15 tilt-rotor aircraft dynamics by frequency and time-domain identification techniques
p 94 N88-11657

Y**YAW**

- Reduced order variable structure control of the lateral motion of an aircraft p 101 A88-14939

ZERO LIFT

Planform effects on the supersonic aerodynamics of
multibody configurations
[NASA-TP-2762]

p 79 N88-12454

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

A

- ABBOTT, TERENCE S.**
Effects of combining vertical and horizontal information into a primary flight display
[NASA-TP-2783] p 98 N88-12487
- ABERNETHY, ROBERT B.**
In-flight thrust determination
[SAE AIR 1703] p 91 A88-15227
Uncertainty of in-flight thrust determination
[SAE AIR 1678] p 92 A88-15228
- ACHACHE, MARC**
Active control of helicopter vibration using multiloop self-adaptive control p 103 N88-11660
- ADAMS, GARY R.**
In-flight thrust determination
[SAE AIR 1703] p 91 A88-15227
Uncertainty of in-flight thrust determination
[SAE AIR 1678] p 92 A88-15228
- ADAMS, L.**
The flight evaluation of an advanced engine display and monitoring system p 97 N88-11659
- ADKINS, JAMES A.**
Engine/airframe response evaluation of the HH-60A helicopter equipped with the T700-GE-701 transient droop improvement electronic control unit
[AD-A184443] p 103 N88-12492
- AIKMAN, JOHN R.**
The Cyclo-Crane - An LTA hybrid success story p 66 A88-16653
- AKISHITA, SADA O**
Numerical simulation of aerodynamic sound radiation from two-dimensional wing
[AIAA PAPER 87-2672] p 123 A88-16536
- ALBERS, JAMES A.**
Civil applications of high-speed rotorcraft and powered-lift aircraft configurations
[NASA-TM-100035] p 85 N88-11643
V/STOL aircraft configurations and opportunities in the Pacific Basin
[NASA-TM-100005] p 85 N88-11644
- ALLAIRE, A. J. S.**
The effect of pitch location on dynamic stall p 74 A88-14163

- ALLEGRE, J.**
Slip effects on supersonic flowfields around NACA 0012 airfoils p 78 A88-16857
- ALLEN, RICHARD M.**
Flow-induced noise from wind tunnel turbulence reduction screens
[AIAA PAPER 87-2728] p 125 A88-16569
- ALLI, PIETRO**
The EH-101 integrated project: A naval, utility and commercial helicopter system p 95 N88-11672
- AMANN, JUSTIN H.**
Research on airship flight dynamics at the University of Toronto p 101 A88-14311
- AONO, H.**
Three-dimensional photoelastic analysis of aeroengine rotary parts p 114 A88-15145
- APPA, K.**
Constant pressure panel method for supersonic unsteady airload analysis p 77 A88-15720
- ARINICHEV, S. V.**
A reliability concept for optimizing aircraft design p 97 N88-12622
- ARIYE, M.**
Renewed interest in airships for industry use discussed p 82 N88-12628
- ARMITI, LUCIANO**
The EH-101 integrated project: A naval, utility and commercial helicopter system p 95 N88-11672
- ARTLEY, M. E.**
Probabilistic durability analysis methods for metallic airframes p 113 A88-14925
- ASCOUGH, JOHN C.**
In-flight thrust determination
[SAE AIR 1703] p 91 A88-15227
Uncertainty of in-flight thrust determination
[SAE AIR 1678] p 92 A88-15228
- ASHWORTH, JEFFREY CLAYTON**
Three-dimensional unsteady flow elicited by finite wings and complex configurations p 81 N88-12468
- ASLIN, P. P.**
Reduced order variable structure control of the lateral motion of an aircraft p 101 A88-14939
- ASO, SHIGERU**
A study of a multi-layered thin film heat transfer gauge and a new method of measuring heat transfer rate with it p 113 A88-14248
- ATWAL, MAHABIR S.**
Light aircraft sound transmission studies - Noise reduction model p 92 A88-16471

B

- BADYAGIN, A. A.**
Optimum take-off run of aircraft on ground airfields p 97 N88-12623
- BAER-RIEDHART, JENNIFER L.**
In-flight thrust determination
[SAE AIR 1703] p 91 A88-15227
Uncertainty of in-flight thrust determination
[SAE AIR 1678] p 92 A88-15228

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

FOREIGN TECHNOLOGY INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 224)

March 1988

Typical Foreign Technology Index Listing

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 224)

March 1988

Typical Contract Number Index Listing

Listings in this index are arranged alpha-numerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

REPORT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 224)

March 1988

Typical Report Number Index Listing

Listings in this index are arranged alphabetically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

ACCESSION NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 224)

March 1988

Typical Accession Number Index Listing

Listings in this index are arranged alpha-numerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A88-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at \$10.00 per document (up to 50 pages), additional pages \$0.25 each. Microfiche⁽¹⁾ of documents announced in *IAA* are available at the rate of \$4.00 per microfiche on demand. Standing order microfiche are available at the rate of \$1.45 per microfiche for *IAA* source documents and \$1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is \$2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

STAR ENTRIES (N88-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report number* shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.
- Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on the page titled ADDRESSES OF ORGANIZATIONS.
- Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of \$1.50 each, postage free. (See discussion of NASA patents and patent applications below.)
- Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC: NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN: An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA – Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 88-914100 at the price of \$8.50 domestic and \$17.00 foreign. The price of the annual index is \$14.50. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.
